## NOTES

1. All parameters NOT specially mentioned are measured at 230 VAC input, rated load, and $25^{\circ} \mathrm{C}$ ambient temperature.
2. Ripple \& noise are measured at 20 MHz bandwidth by using a $12^{\prime \prime}$ twisted pair-wire terminated with a $0.1 \mathrm{uF} \& 47 \mathrm{uF}$ parallel capacitor .
3. Tolerances include set up tolerance, line regulation, and load regulation.
4. $10 \%$ Duty cycle maximum within every 30 seconds (max.). Average output power should not exceed the rated power.
5. The power supply is considered a component, which will be installed into final equipment. The final equipment must be re-confirmed that it still meets EMC directives.
6. Derating may be needed under low input voltages. Please check the derating curve for more details.
