

500mA Dual Linear Regulator with Internal Power Switch

FEATURES

- Continuous 3.3V Output from Three Inputs.
- Complete Power Management Solution.
- V_{CC} , V_{SBY} Regulator Supplies 500mA Output.
- Built-in Hysteresis When Selecting Input Supplies.
- Integrated Switch has Very Low $R_{DS(ON)}$ 120m Ω (typ.).
- Integrated Switch Supplies 500mA From V_{AUX} .
- Output can be Forced Higher than Input (Off-State).

APPLICATIONS

- Desktop Computers.
- PCI Adapter Cards with Wake-On-LAN.
- Network Interface Cards (NICs).
- Multi Power System.
- System with Standby Capabilities.

DESCRIPTION

The **SS6531** is a dual input regulator with V_{AUX} switch capable of delivering 3.3V/500mA continuously. The output power is provided from three independent input voltage sources on a prioritized basis. Power is always taken in priority using the following order V_{CC} , V_{SBY} , and V_{AUX} .

The **SS6531** meets Intel's "Instantly Available" power requirements which follows the "Advanced Configuration and Power Interface" (ACPI) standards. When either V_{CC} or V_{SBY} is present, the device automatically enables the regulator and produces a stable 3.3V output V_{OUT} . When only V_{AUX} (3.3V) is present, the device provides a low impedance direct connection (120m Ω typ.) from V_{AUX} to V_{OUT} .

The **SS6531** also prevents excessive current from flowing V_{OUT} to either input voltage or ground when the output voltage is higher than the input voltage.

All the necessary control circuitry needed to provide a smooth and automatic transition between all the three supplies has been incorporated. This allows both V_{CC} and V_{SBY} to be dynamically switched without loss of output voltage.

TYPICAL APPLICATION CIRCUIT

Dual input regulator with auxiliary power switch

ORDERING INFORMATION

SS6531CXXX

PACKING TYPE
TR: TAPE & REEL
TB: TUBE

PACKAGE TYPE
N: PLASTIC DIP
S: SMALL OUTLINE

PIN CONFIGURATION

DIP-8
SO-8

BLOCK DIAGRAM

PIN DESCRIPTION

- PIN 1: VSBY - Standby supply voltage (5V) input for 3.3V regulator when VCC falls below VCCDES. Some NICs that operate in "Wake-On-LAN" mode get a 5V standby through a cable that connects directly to a specific header on the Motherboard.
- PIN 2: VCC - Primary supply voltage (5V) input for 3.3V regulator.
- PIN 3: VOUT - 3.3V regulated output voltage when either VCC or VSBY is

present. When only V_{AUX} (3.3V) is present, V_{OUT} voltage comes from V_{AUX} through an internal low impedance switch.

- PIN 4: AUX - Auxiliary supply voltage (3.3V) input for low impedance switch.
- PIN 5-8: GND - Negative reference for all voltages.

APPLICATIONS INFORMATION

The Requirement for External Capacitors

The selection of the output capacitor is based on two requirements: LDO compensation and the transition between power sources. During the takeover between sources, the output capacitor provides the loading. Therefore a larger output capacitor can improve the transition. And since the output capacitor plays the important role in the compensation of LDO, a 10μF Tantalum capacitor or larger is recommended.

The input capacitor is required to be as close to the

IC as possible. The input capacitor can reduce the parasitic effect formed by the power supply output impedance or the trace. A 10μF Tantalum capacitor is a good choice. Additional ceramic capacitor can be placed close to input and output to reduce the high frequency noise. A 0.1μF is recommended.

The layout and Thermal Considerations

The SS6531 is housed in a thermally enhanced package where the GND pins (Pin5 to Pin8) are integrated to the leadframe. Generally,

heat sinks are not available for most surface-mounted devices. Instead, they rely on the printed-circuit board to provide the thermal path. When the SS6531 operates normally, the maximum power dissipation is

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} = (5 - 3.3) \times 0.5 = 0.85W$$

At the maximum operation temperature, the thermal resistance seen by the device, or the combination of all the thermal paths, should be

$$R_{JA} < \frac{165 - 85}{0.85} = 94^{\circ}C/W$$

When the device is mounted on a double-sided printed circuit board, the ground plane is the most

used thermal path. To make sure the thermal resistance small enough and the shutdown function work normally, the thermal resistance between GND pins to GND plane should be as small as possible by means of adding more vias. And the GND plane should be at least 1 square centimeters of copper.

The layout of SS6531 is shown in Fig.1. In Fig. 2, the thermal resistance R_{JA} is $70.36^{\circ}C/W$ where the SS6531 is mounted on the double-sided PCB and measured under the forced-air thermal chamber.
