Precision Low Power FGA™ Voltage References

The ISL60002 FGA™ voltage references are very high precision analog voltage references fabricated in Intersil's proprietary Floating Gate Analog technology and feature low supply voltage operation at ultra-low 350nA operating current.

Additionally, the ISL60002 family features guaranteed initial accuracy as low as ±1.0mV and 20ppm/°C temperature coefficient. The initial accuracy and temperature stability performance of the ISL60002 family, plus the low supply voltage and 350nA power consumption, eliminates the need to compromise thermal stability for reduced power consumption making it an ideal companion to high resolution, low power data conversion systems.

Pin Descriptions

PIN NUMBER	PIN NAME	DESCRIPTION
1	V_{IN}	Power Supply Input
2	V_{OUT}	Voltage Reference Output
3	GND	Ground

Features

- Reference Voltages . . . 1.024V, 1.2V, 1.25V, 1.8V, 2.048V, 2.5V, 2.6V, 3.0V and 3.3V
- Absolute Initial Accuracy Options. . . . . . . ±1.0mV, ±2.5mV and ±5.0mV
- Supply Voltage Range
  - ISL60002-10, -11, -12, -18, -20, -25 . . . . . . 2.7V to 5.5V
  - ISL60002-26 . . . . 2.8V to 5.5V
  - ISL60002-30 . . . . 3.2V to 5.5V
  - ISL60002-33 . . . . 3.5V to 5.5V
- Ultra-Low Supply Current. . . . . 350nA typ
- Low 20ppm/°C Temperature Coefficient
- I_{SOURCE} and I_{SINK} = 7mA
- I_{SOURCE} and I_{SINK} = 20mA for ISL60002-33 only
- ESD Protection. . . . . 5500V (Human Body Model)
- Standard 3 Ld SOT-23 Packaging
- Operating Temperature Range
  - ISL60002-10, -11, -12, -18, -20, -25, -26, -30 . . . . -40°C to +85°C
  - ISL60002-33 . . . . -40°C to +105°C
- Pb-Free (RoHS Compliant)

Applications

- High Resolution A/Ds and D/As
- Digital Meters
- Bar Code Scanners
- Mobile Communications
- PDA’s and Notebooks
- Medical Systems

Table of Contents

Typical Application

*Please refer to TB347 for details on reel specifications.

NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Absolute Maximum Ratings

Max Voltage V_{IN} to GND . . . . -0.5V to +6.5V
Max Voltage V_{OUT} to GND (10s): . . . . -0.5V to $+V_{OUT}$ + 1V
Voltage on “DNC” pins . . . . . No connections permitted to these pins
ESD Ratings
Human Body Model 5500V
Machine Model. 550V
Charged Device Model. 2kV

Thermal Information

Thermal Resistance (Typical, Note 1) θ_{JA} (°C/W)
3 Ld SOT-23. . . . . 202.70
Continuous Power Dissipation (T_A = +85°C). 99mW
Maximum Junction Temperature (Plastic Package) . . . . +107°C
Storage Temperature Range . . . . -65°C to +150°C
Pb-free Reflow Profile (Note 2) . . . . see link below
http://www.intersil.com/pbfree/Pb-FreeReflow.asp

Recommended Operating Conditions

Temperature Range
Industrial. . . . . -40°C to +85°C
3.3V Version. . . . . -40°C to +105°C

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

1. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
2. Post-reflow drift for the ISL60002 devices will range from 100µV to 1.0mV based on experimental results with devices on FR4 double sided boards. The design engineer must take this into account when considering the reference voltage after assembly.

Electrical Specifications ISL60002-10, V_{OUT} = 1.024V

(Additional specifications on page 8, “Common Electrical Specifications”) Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			1.024		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B10	-1.0		+1.0	mV
		ISL60002C10	-2.5		+2.5	mV
		ISL60002D10	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-11, V_{OUT} = 1.200V

(Additional specifications on page 8, “Common Electrical Specifications”) Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			1.200		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B11	-1.0		+1.0	mV
		ISL60002C11	-2.5		+2.5	mV
		ISL60002D11	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-12, V_{OUT} = 1.250V

(Additional specifications on page 8, “Common Electrical Specifications”) Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			1.250		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B12	-1.0		+1.0	mV
		ISL60002C12	-2.5		+2.5	mV
		ISL60002D12	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-18, V_{OUT} = 1.800V (Additional specifications on page 8, "Common Electrical Specifications") Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			1.800		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B18	-1.0		+1.0	mV
		ISL60002C18	-2.5		+2.5	mV
		ISL60002D18	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-20, V_{OUT} = 2.048V (Additional specifications on page 8, "Common Electrical Specifications") Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			2.048		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B20	-1.0		+1.0	mV
		ISL60002C20	-2.5		+2.5	mV
		ISL60002D20	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-25, V_{OUT} = 2.500V (Additional specifications on page 8, "Common Electrical Specifications") Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			2.500		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B25	-1.0		+1.0	mV
		ISL60002C25	-2.5		+2.5	mV
		ISL60002D25	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.7		5.5	V

Electrical Specifications ISL60002-26, V_{OUT} = 2.600V (Additional specifications on page 8, "Common Electrical Specifications") Operating Conditions: V_{IN} = 3.0V, I_{OUT} = 0mA, C_{OUT} = 0.001µF, T_A = -40 to +85°C, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OUT}	Output Voltage			2.600		V
V_{OA}	V_{OUT} Accuracy (Note 3)	T_A = +25°C				
		ISL60002B26	-1.0		+1.0	mV
		ISL60002C26	-2.5		+2.5	mV
		ISL60002D26	-5.0		+5.0	mV
V_{IN}	Input Voltage Range		2.8		5.5	V
TC V_{OUT}	Output Voltage Temperature Coefficient (Note 3)				20	ppm/°C

I_{SC}	Short Circuit Current (to GND) (Note 6)	T_A = +25°C		50		mA
V_N	Output Voltage Noise	0.1Hz ≤ f ≤ 10Hz		30		$µV_{P-P}$

NOTES:

3. Over the specified temperature range. Temperature coefficient is measured by the box method whereby the change in V_{OUT} is divided by the temperature range: (-40°C to +85°C = +125°C, or -40°C to +105°C = +145°C for the ISL60002-33).
4. Thermal Hysteresis is the change in V_{OUT} measured @ T_A = +25°C after temperature cycling over a specified range, ΔT_A, V_{OUT} is read initially at T_A = +25°C for the device under test. The device is temperature cycled and a second V_{OUT} measurement is taken at +25°C. The difference between the initial V_{OUT} reading and the second V_{OUT} reading is then expressed in ppm. For ΔT_A = +125°C, the device under is cycled from +25°C to +85°C to -40°C to +25°C, and for ΔT_A = +145°C, the device under is cycled from +25°C to +105°C to -40°C to +25°C
5. Long term drift is logarithmic in nature and diminishes over time. Drift after the first 1000 hours will be approximately 10ppm.
6. Short Circuit Current (to V_{CC}) for ISL60002-25 at V_{IN} = 5.0V and +25°C is typically around 30mA. Shorting V_{OUT} to V_{CC} is not recommended due to risk of resetting the part.

Typical Performance Characteristic Curves ISL60002, V_{OUT} = 1.024V

V_{IN} = 3.0V, I_{OUT} = 0mA, T_A = +25°C unless otherwise specified.

Applications Information

FGA Technology

The ISL60002 series of voltage references use the floating gate technology to create references with very low drift and supply current. Essentially, the charge stored on a floating gate cell is set precisely in manufacturing. The reference voltage output itself is a buffered version of the floating gate voltage. The resulting reference device has excellent characteristics which are unique in the industry: very low temperature drift, high initial accuracy, and almost zero supply current. Also, the reference voltage itself is not limited by voltage bandgaps or zener settings, so a wide range of reference voltages can be programmed (standard voltage settings are provided, but customer-specific voltages are available).

The process used for these reference devices is a floating gate CMOS process, and the amplifier circuitry uses CMOS transistors for amplifier and output transistor circuitry. While providing excellent accuracy, there are limitations in output noise level and load regulation due to the MOS device characteristics. These limitations are addressed with circuit techniques discussed in other sections.

Nanopower Operation

Reference devices achieve their highest accuracy when powered up continuously, and after initial stabilization has taken place. This drift can be eliminated by leaving the power on continuously.

The ISL60002 is the first high precision voltage reference with ultra low power consumption that makes it possible to leave power on continuously in battery operated circuits. The ISL60002 consumes extremely low supply current due to the proprietary FGA technology. Supply current at room temperature is typically 350nA, which is 1 to 2 orders of magnitude lower than competitive devices. Application circuits using battery power will benefit greatly from having an accurate, stable reference, which essentially presents no load to the battery.

In particular, battery powered data converter circuits that would normally require the entire circuit to be disabled when not in use can remain powered up between conversions as shown in Figure 116. Data acquisition circuits providing 12 to 24 bits of accuracy can operate with the reference device continuously biased with no power penalty, providing the highest accuracy and lowest possible long term drift.

Other reference devices consuming higher supply currents will need to be disabled in between conversions to conserve battery capacity. Absolute accuracy will suffer as the device is biased and requires time to settle to its final value, or, may not actually settle to a final value as power on time may be short.

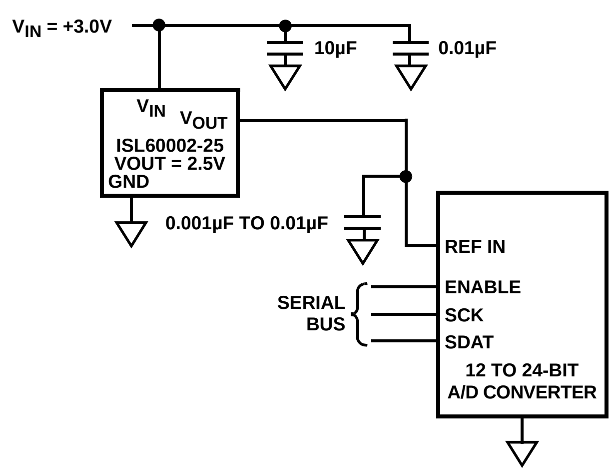

FIGURE 116.

Board Mounting Considerations

For applications requiring the highest accuracy, board mounting location should be reviewed. Placing the device in areas subject to slight twisting can cause degradation of the accuracy of the reference voltage due to die stresses. It is normally best to place the device near the edge of a board, or the shortest side, as the axis of bending is most limited at that location. Obviously mounting the device on flexprint or extremely thin PC material will likewise cause loss of reference accuracy.

Board Assembly Considerations

FGA references provide high accuracy and low temperature drift but some PC board assembly precautions are necessary. Normal Output voltage shifts of 100µV to 1mV can be expected with Pb-free reflow profiles. Precautions should be taken to avoid excessive heat or extended exposure to high reflow temperatures, which may reduce device initial accuracy.

Post-assembly x-ray inspection may also lead to permanent changes in device output voltage and should be minimized or avoided. Most inspection equipment will not affect the FGA reference voltage, but if x-ray inspection is required, it is advisable to monitor the reference output voltage to verify excessive shift has not occurred.

Noise Performance and Reduction

The output noise voltage in a 0.1Hz to 10Hz bandwidth is typically 30µV_{P-P}. This is shown in the plot in the Typical Performance Curves. The noise measurement is made with a bandpass filter made of a 1 pole high-pass filter with a corner frequency at 0.1Hz and a 2-pole low-pass filter with a corner frequency at 12.6Hz to create a filter with a 9.9Hz bandwidth. Noise in the 10kHz to 1MHz bandwidth is approximately 400µV_{P-P} with no capacitance on the output, as shown in Figure 117. These noise measurements are made with a 2 decade bandpass filter made of a 1 pole high-pass filter with a corner frequency at 1/10 of the center frequency and 1-pole low-pass filter with a corner frequency at 10 times the center frequency. Figure 117 also shows the noise in the 10kHz to 1MHz band can be reduced to about 50µV_{P-P} using a 0.001µF capacitor on the output. Noise in the 1kHz to 100kHz band can be further reduced using a 0.1µF capacitor on the output, but noise in the 1Hz to 100Hz band increases due to instability of the very low power amplifier with a 0.1µF capacitance load. For load capacitances above 0.001µF the noise reduction network shown in Figure 118 is recommended. This network reduces noise significantly over the full bandwidth. As shown in Figure 117, noise is reduced to less than 40µV_{P-P} from 1Hz to 1MHz using this network with a 0.01µF capacitor and a 2kΩ resistor in series with a 10µF capacitor.

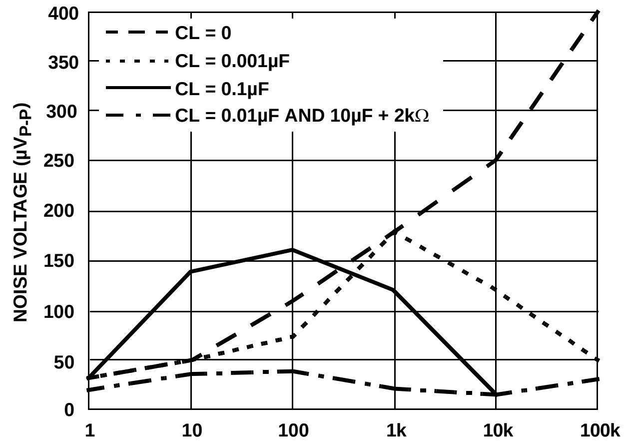

FIGURE 117. NOISE REDUCTION

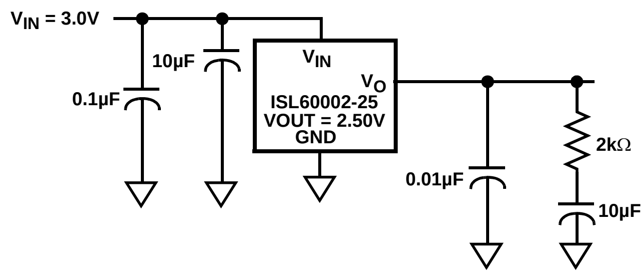

FIGURE 118. NOISE REDUCTION NETWORK

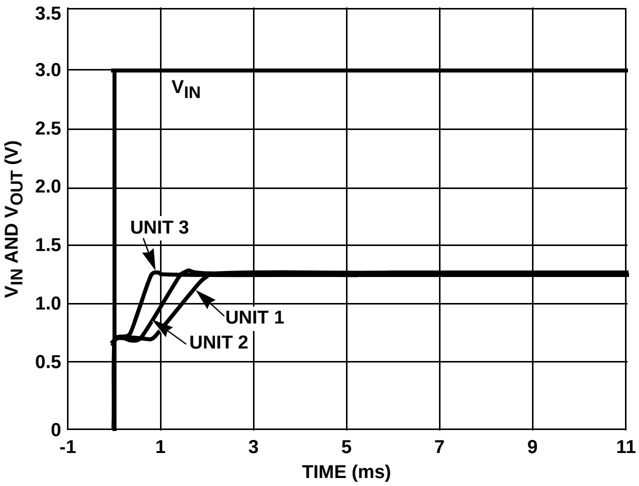
Turn-On Time

The ISL60002 devices have ultra-low supply current and thus the time to bias up internal circuitry to final values will be longer than with higher power references. Normal turn-on time is typically 7ms. This is shown in Figure 119. Since devices can vary in supply current down to >300nA, turn-on time can last up to about 12ms. Care should be taken in system design to include this delay before measurements or conversions are started.



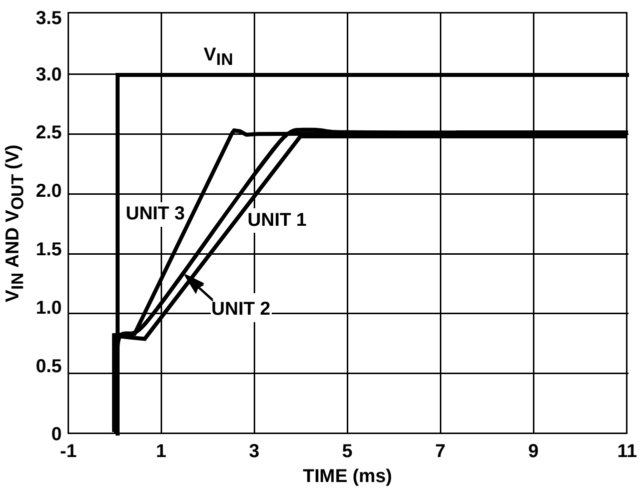


FIGURE 119. TURN-ON TIME

Temperature Coefficient

The limits stated for temperature coefficient (tempco) are governed by the method of measurement. The overwhelming standard for specifying the temperature drift of a reference is to measure the reference voltage at two temperatures, take the total variation, ($V_{HIGH} – V_{LOW}$), and divide by the temperature extremes of measurement ($T_{HIGH} – T_{LOW}$). The result is divided by the nominal reference voltage (at T = +25°C) and multiplied by 10^6 to yield ppm/°C. This is the “Box” method for specifying temperature coefficient.

NOTES:

1. Dimensioning and tolerance per ASME Y14.5M-1994.
2. Package conforms to EIAJ SC-74 and JEDEC MO178AB.
3. Dimensions D and E1 are exclusive of mold flash, protrusions, or gate burrs.
4. Footlength L measured at reference to gauge plane.
5. “N” is the number of terminal positions.
6. These Dimensions apply to the flat section of the lead between 0.08mm and 0.15mm from the lead tip.
7. Controlling dimension: MILLIMETER. Converted inch dimensions are for reference only
8. Die is facing up for mold die and trim-form.
