

Low Cost 6 Channel LED Backlight Driver with Integrated Power Supply

The 34845 series represents high efficiency LED drivers for use in backlighting LCD displays from 10" to 17"+. Operating from supplies of 5.0 V to 21 V, the 34845 series is capable of driving up to 16 LEDs in series in 6 separate strings. The LED current tolerance in the 6 strings is within $\pm 2\%$ maximum and is set using a resistor to GND.

PWM dimming is performed by applying a PWM input signal to the PWM pin which modulates the LED channels directly. An Enable Pin (EN) provides for low power standby. Alternatively, a single wire scheme selects power down when PWM is connected to the Wake Pin and held low.

The integrated boost converter uses dynamic headroom control to automatically set the output voltage. There are three device versions for boost frequency; 34845 is 600 kHz, 34845A is 1.2 MHz and the 34845B is 300 kHz. External compensation allows the use of different inductor/capacitor combinations.

The 34845 includes fault protection modes for LED short and open, over temperature, over current and over voltage errors. It features an internally fixed OVP value of 60 V (typical) which protects the device in the event of a failure in the externally programmed OVP. The OVP level can be set by using an external resistor divider.

Features

- Input voltage of 5.0 to 21 V
- Boost output voltage up to 60 V
- 2.0 A integrated boost FET
- Fixed boost frequency - 300 kHz, 600 kHz or 1.2 MHz
- OTP, OCP, UVLO fault detection
- LED short/open protection
- Programmable LED current between 3.0 mA and 30 mA
- 24-Ld 4x4x0.65 mm μ QFN Package

34845 34845A/B

Thermal Resistance Junction to Case ⁽⁵⁾	$T_{\theta JC}$	3.1	°C/W
Power Dissipation ⁽⁴⁾ TA = 25°C TA = 85°C	P_D	3.4 1.8	W

Notes

- ESD testing is performed in accordance with the Human Body Model (HBM) (AEC-Q100-2) ($C_{ZAP} = 100$ pF, $R_{ZAP} = 1500$ Ω), and the Machine Model (MM) ($C_{ZAP} = 200$ pF, $R_{ZAP} = 0$ Ω).
- Pin soldering temperature limit is for 10 seconds maximum duration. Not designed for immersion soldering. Exceeding these limits may cause malfunction or permanent damage to the device.
- Freescale's Package Reflow capability meets Pb-free requirements for JEDEC standard J-STD-020C. For Peak Package Reflow Temperature and Moisture Sensitivity Levels (MSL), Go to www.freescale.com, search by part number [e.g. remove prefixes/suffixes and enter the core ID to view all orderable parts. (i.e. MC33xxxD enter 33xxx)], and review parametrics.
- Per JEDEC51-8 Standard for Multilayer PCB
- Theoretical thermal resistance is from the die junction to the exposed pad.

STATIC AND DYNAMIC ELECTRICAL CHARACTERISTICS

Table 3. Static and Dynamic Electrical Characteristics

Characteristics noted under conditions $V_{IN} = 12\text{ V}$, $V_{OUT} = 35\text{ V}$, $I_{LED} = 30\text{ mA}$, $f_S = 600\text{ kHz}$, $f_{PWM} = 600\text{ Hz}$ - $40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$, unless otherwise noted. Typical values noted reflect the approximate parameter means at $T_A = 25^\circ\text{C}$ under nominal conditions, unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit
SUPPLY					
Supply Voltage	V_{IN}	5.0	10	21	V
Supply Current when in Shutdown Mode EN = Low, PWM = Low	$I_{SHUTDOWN}$	-	2.0	10	μA

Figure 3. 34845 Pin Connections

Table 4. 34845 Pin Definitions

Pin Number	Pin Name	Definition
1	VIN	Main voltage supply Input. IC Power input supply voltage, is used internally to produce internal voltage regulation for logic functioning, and also as an input voltage for the boost regulator.
2	PGNDB	Power ground. This is the ground terminal for the internal Boost FET.
3	SWB	Boost switch node connection B. Switching node of boost converter.
4	SWA	Boost switch node connection A. Switching node of boost converter.
5	PGNDA	Power ground. This is the ground terminal for the internal Boost FET.
6	EN	Enable pin (active high, internal pull-down).
7 - 12	CH1 - CH6	LED string connections 1 to 6. LED current drivers. Each line has the capability of driving up to 30 mA.
13, 19, 21	GND	Ground Reference for all internal circuits other than the Boost FET. The Exposed Pad (EP) should be used for thermal heat dissipation.
14	FAIL	Fault detected pin (open drain): No Failure = Low-impedance pull-down Failure = High-impedance When a fault situation is detected, this pin goes into high impedance.
15	ISET	LED current setting. The maximum current is set using a resistor from this pin to GND.
16	PWM	External PWM control signal.
17	COMP	Boost compensation component connection. This passive terminal is used to compensate the boost converter. Add a capacitor and a resistor in series to GND to stabilize the system as well as a shunt capacitor.
18	WAKE	Low power consumption mode for single wire control. This is achieved by connecting the WAKE and PWM pins together and grounding the ENABLE (EN) pin.
20	VDC1	2.5 V internal voltage decoupling. This pin is for internal use only, and not to be used for other purposes. A capacitor of 2.2 μ F should be connected between this pin and ground.
22	OVP	External boost over-voltage setting. Requires a resistor divider from VOUT to GND. If no external OVP setting is desired, this pin should be grounded.

Table 4. 34845 Pin Definitions (continued)

Pin Number	Pin Name	Definition
23	VDC2	6.0 V internal voltage decoupling. This pin is for internal use only, and not to be used for other purposes. A capacitor of 2.2 μ F should be connected between this pin and ground.
24	VOOUT	Boost voltage output feedback.
EP	EP	Ground and thermal enhancement pad

FUNCTIONAL DESCRIPTION

INTRODUCTION

LED backlighting has been popular for use in small LCD displays for many years. This technology is now rapidly replacing the incumbent Cold Cathode Fluorescent Lamp (CCFL) in mid-size displays such as those used in notebooks, monitors and industrial/ consumer displays. LEDs offer a number of advantages compared to the CCFL, including lower power, thinner, longer lifetime, low voltage drive, accurate wide-range dimming control and advanced architectures for improved image quality. LEDs are also void of hazardous materials such as mercury which is used in CCFL.

LED backlights use different architecture depending on the size of the display and features required. For displays in the 7" to 17" range such as those used in notebooks, edge-lit backlights offer very thin designs down to 2mm or less. The efficiency of the LED backlight also extends battery life in

portable equipment compared to CCFL. In large size panels, direct backlights support advanced architectures such as local dimming, in which power consumption and contrast ratio are drastically improved. Edge lighting can also be used in large displays when low cost is the driving factor.

The 34845 targets mid size panel applications in the 7" to 17" range with edge-lit backlights. The device supports LED currents up to 30mA and supports up to 6 strings of LEDs. This enables backlights up to 10W to be driven from a single device. The device includes a boost converter to deliver the required LED voltage from either a 2 or 3 cell Li-ion battery, or a direct 12V input supply. The current drivers match the current between devices to provide superior uniformity across the display. The 34845 provides for a wide range of PWM dimming from a direct PWM control input.

FUNCTIONAL DEVICE OPERATION

POWER SUPPLY

The 34845 supports 5.0 V to 21 V at the VIN input pin. Two internal regulators generate internal rails for internal operation. Both rails are de-coupled using capacitors on the VDC1 and VDC2 pins.

The VIN, VDC1, and VDC2 supplies each have their own UVLO mechanisms. When any voltage is below the UVLO threshold, the device stops operating. All UVLO comparators have hysteresis to ensure constant on/off cycling does not occur.

The power up sequence for applying VIN respect to the ENABLE and PWM signals is important since the MC34845 device will behave differently depending on how the sequence of these signals is applied. For the case where VIN is applied before the ENABLE and PWM signals, the device will have no limitation in terms of how fast the VIN ramp should be. However for the case where the PWM and ENABLE signals are applied before VIN, the ramp up time of VIN between 0V and 5V should be no longer than 2ms.

Figures 4 and 5 illustrate the two different power up conditions.

Figure 4. Power up sequence case 1, VIN applied before the ENABLE and PWM signals. No limitation for VIN ramp up time.

Figure 5. Power up sequence case 2, VIN applied after the ENABLE and PWM signals. VIN ramp up time between 0V and 5V should be not higher than 2ms.

BOOST CONVERTER

The boost converter uses a Dynamic Headroom Control (DHC) loop to automatically set the output voltage needed to drive the LED strings. The DHC is designed to operate under specific pulse width conditions in the LED drivers. It operates for pulse widths higher than 400 ns. If the pulse widths are shorter than specified, the DHC circuit will not operate and the voltage across the LED drivers will increase to a value given by the OVP, minus the total LED voltage in the LED string. It is therefore imperative to select the proper OVP level to avoid exceeding the max off state voltage of the LED drivers (45 V).

The boost operates in current mode and is compensated externally through a type 2 network on the COMP pin. A modification of the compensation network is suggested to minimize the amplitude of the ripple at V_{OUT} . The details of the suggested compensation network are shown in [Figures 10 and 11](#).

An integrated 2.0 A minimum FET supplies the required output current. An Over-current Protection circuit limits the output current cycle-by-cycle to I_{OCP} . If the condition exists longer than 10 ms, then the device will shut down. The frequency of the boost converter is internally set to 300 kHz, 600 kHz or 1.2 MHz, depending on the device's version.

The boost also includes a soft start circuit. Each time the IC comes out of shutdown mode, the soft start period lasts for t_{ss} .

Over-voltage Protection is also included. The device has an internally fixed OVP value of 60 V (typical) which serves as a secondary fault protection mechanism, in the event the externally programmed OVP fails (i.e. resistor divider opens up). While the internal 60 V OVP detector can be used exclusively without the external OVP network, this is only recommended for applications where the LED string voltage approaches 55 V or more. The OVP level can be set by using an external resistor divider connected between the output

voltage and ground with its output connected to the OVP pin. The OVP can be set up to 60 V by varying the resistor divider to match the OVP internal reference of 6.9 V (typical).

LED DRIVER

The 6 channel LED driver provides current matching for 6 LED strings to within $\pm 2\%$ maximum. The current in the strings is set using a resistor tied to GND from the ISET pin. The LED current level is given by the equation: $RSET = 153/I_{LED}$. The accuracy of the RSET resistor should be 0.1% for best performance.

LED ERROR DETECT

If an LED is open, the output voltage ramps to the OVP level. If there is still no current in the LED string, the LED channel is turned off and the output voltage ramps back down to normal operating level.

If LEDs are shorted and the voltage in any of the channels is greater than the SFDV threshold (7.0 V typical), then the device will turn off that channel. However if the on-time of the channels is less than 10 μs , the SFDV circuit will not disable any of the channels, regardless of the voltage across them.

All the LED errors can be cleared by recycling the EN pin or applying a complete power-on-reset (POR).

WAKE OPERATION

The WAKE pin provides the means to set the device for low power consumption (shutdown mode) without the need of an extra logic signal for enable. This is achieved by connecting the WAKE and PWM pins together, and tying the EN pin to ground. In this configuration, the PWM signal is used to control the LED channels, while allowing low power consumption by setting the device into its shutdown mode every time the PWM signal is kept low for longer time than the WAKE time out of 27 ms.

OVER-TEMPERATURE SHUTDOWN AND TEMPERATURE CONTROL CIRCUITS

The 34845 includes over-temperature protection. If the internal temperature exceeds the over-temp threshold $OTT_{SHUTDOWN}$, then the device shuts down all functions. Once the temperature falls below the low level threshold, the device is re-enabled.

FAIL PIN

The FAIL pin is at its low-impedance state when no error is detected. However, if an error such as an LED channel open or boost over-current is detected, the FAIL pin goes into high-impedance. Once a failure is detected, the FAIL pin can be cleared by recycling the EN pin or applying a complete power-on-reset (POR). If the detected failure is an Over-current time-out, the EN pin or a POR must be cycled/executed to restart the part.

TYPICAL PERFORMANCE CURVES

TYPICAL APPLICATIONS

Figure 10. Typical Application Circuit for Single Wire Control, $f_s = 600$ KHz
($V_{IN} = 9.0$ V, $I_{LED}/channel = 20$ mA/channel, 12 LEDs/channel, $OVP = 45$ V, $V_{PWM} = 3.3$ V)

Figure 11. Typical Application Circuit for Single Wire Control, $f_s = 1.2$ MHz
($V_{IN} = 9.0$ V, $I_{LED} = 20$ mA/channel, 12 LEDs/channel, $OVP = 45$ V, $V_{PWM} = 3.3$ V)

Figure 12. Typical Application Circuit for Single Wire Control, $f_s = 300 \text{ kHz}$
($V_{IN} = 8.0 \text{ V}$, $I_{LED} = 20 \text{ mA/channel}$, 14 LEDs/channel, $OVP = 49 \text{ V}$, $V_{PWM} = 3.3 \text{ V}$)

COMPONENTS CALCULATION

The following formulas are intended for the calculation of all external components related with the boost converter and network compensation.

In order to calculate the Duty Cycle, the internal losses of the MOSFET and Diode should be taken into consideration:

$$D = \frac{V_{OUT} + V_D - V_{IN}}{V_{OUT} + V_D - V_{SW}}$$

The average input current depends directly on the output current when the internal switch is off.

$$I_{IN-AVG} = \frac{I_{OUT}}{1-D}$$

Inductor

For calculating the Inductor, consider the losses of the internal switch and winding resistance of the inductor:

$$L = \frac{(V_{IN} - V_{SW} - (I_{IN-AVG} \times R_{INDUCTOR})) \times D}{I_{IN-AVG} \times r \times F_{SW}}$$

It is important to look for an inductor rated at least for the maximum input current:

$$I_{IN-MAX} = I_{IN-AVG} + \frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times L \times F_{SW} \times V_{OUT}}$$

Input Capacitor

The input capacitor should handle at least the following RMS current.

$$I_{RMS-C_{IN}} = \left(\frac{V_{IN} \times (V_{OUT} - V_{IN})}{2 \times L \times F_{SW} \times V_{OUT}} \right) \times 0.3$$

Output Capacitor

For the output capacitor selection the transconductance should be taken in consideration.

$$C_{OUT} = \frac{R_{COMP} \times 5 \times G_M \times I_{OUT} \times L}{(1-D) \times V_{OUT} \times 0.35}$$

The output voltage ripple (ΔV_{OUT}) depends on the ESR of the Output capacitor. For a low output voltage ripple, it is recommended to use ceramic capacitors that have a very low ESR. Since ceramic capacitor are costly, electrolytic or tantalum capacitors can be mixed with ceramic capacitors for a less expensive solution.

$$ESR_{C_{OUT}} = \frac{V_{OUT} \times \Delta V_{OUT} \times F_{SW} \times L}{V_{OUT} \times (1-D)}$$

The output capacitor should at least handle the following RMS current.

Network Compensation

Since this Boost converter is current controlled, a Type II compensation is needed.

$$I_{RMS-C_{OUT}} = I_{OUT} \times \sqrt{\frac{D}{1-D}}$$

Note that before calculating the network compensation, all boost converter components need to be known.

For this type of compensation it is recommended to push out the Right Half Plane Zero to higher frequencies where it will not significantly affect the overall loop.

$$f_{RHPZ} = \frac{V_{OUT} \times (1-D)^2}{I_{OUT} \times 2\pi \times L}$$

The crossover frequency must be set much lower than the location of the Right half plane zero:

$$f_{CROSS} = \frac{f_{RHPZ}}{5}$$

Since our system has a fixed slope compensation, R_{COMP} should be fixed for all configurations, i.e. $R_{COMP} = 8.2 \text{ Kohm}$

C_{COMP1} and C_{COMP2} should be calculated as follows:

$$C_{COMP1} = \frac{2}{2\pi \times f_{CROSS} \times R_{COMP}}$$

$$C_{COMP2} = \frac{G_M}{6.28 \times F_{SW}}$$

The recommended values of these capacitors for an acceptable performance of the system in different operating conditions are $C_{comp1}=2.2\text{nF}$ and $C_{comp2}=56\text{pF}$.

In order to improve the transient response of the boost a resistor divider has been implemented from the PWM pin to ground with a connection to the compensation network. This configuration should inject a 1V signal to the COMP pin and the equivalent Thevenin resistance of the divider is close to R_{COMP} , i.e. $10\text{k}\Omega$ and $39\text{k}\Omega$.

If a faster transient response is needed, a higher voltage (e.g. 1.3V) should be injected to the COMP pin; so the resistor divider should be modified accordingly but keeping the equivalent Thevenin resistance of the divider close to R_{COMP} .

Variable definition

D = Duty cycle
 V_{OUT} = Output voltage
 V_D = Diode voltage
 V_{IN} = Input voltage
 V_{SW} = Internal switch voltage drop.
 ΔV_{OUT} = Output voltage ripple
 I_{IN-AVG} = Average input current = I_{L-AVG}
 I_{OUT} = Output current
 I_{IN-MAX} = Maximum input current
 r = Current ripple ratio at the inductor = $\Delta I_L / I_{L-AVG}$
 $I_{RMS-CIN}$ = RMS current for the input capacitor

$I_{RMS-COUT}$ = RMS current for output capacitor
 L = Inductor.
 $R_{INDUCTOR}$ = Inductor winding resistor
 F_{SW} = Boost switching frequency
 C_{OUT} = Output capacitor
 R_{COMP} = Compensation resistor
 G_M = OTA transconductance
 ESR_{COUT} = ESR of the output capacitor
 f_{RHPZ} = Right half plane zero frequency
 f_{CROSS} = Crossover frequency
 C_{COMP1} = Compensation capacitor
 C_{COMP2} = Shunt compensation capacitor

PACKAGING

PACKAGE DIMENSIONS

For the most current package revision, visit www.freescale.com and perform a keyword search using the "98A" listed below.

© FREESCALE SEMICONDUCTOR, INC. ALL RIGHTS RESERVED.	MECHANICAL OUTLINE	PRINT VERSION NOT TO SCALE
TITLE: THERMALLY ENHANCED QUAD FLAT NON-LEADED PACKAGE (QFN) 24 TERMINAL, 0.5 PITCH (4 X 4 X 0.65)	DOCUMENT NO: 98ASA00087D	REV: A
	CASE NUMBER: 2084-02	15 JUL 2009
	STANDARD: NON-JEDEC	

EP SUFFIX

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
3. THIS IS NON JEDEC REGISTERED PACKAGE.
4.  COPLANARITY APPLIES TO LEADS AND DIE ATTACH PAD.
5.  MIN. METAL GAP SHOULD BE 0.145MM.
