DRV8872具有故障报告功能的 3.6A 刷式直流电机驱动器（PWM 控制）

1 特性

- H 桥电机驱动器
  - 驱动一个直流电机、一个步进电机的绕组或其他负载
- 6.5V 至 45V 宽工作电压范围
- 565mΩ（典型值）$R_{DS(on)}$ (HS + LS)
- 3.6A 峰值电流驱动能力
- 脉宽调制 (PWM) 控制接口
- 集成电流调节功能
- 低功耗休眠模式
- 故障状态输出引脚
- 小型封装尺寸
  - 8 引脚 HSOP 封装，带有 PowerPAD™
  - 4.9mm × 6mm
- 集成保护 功能
  - VM 欠压闭锁 (UVLO)
  - 过流保护 (OCP)
  - 热关断 (TSD)
  - 故障报告 (nFAULT)
  - 自动故障恢复

2 应用范围

- 打印机
- 电器
- 工业设备
- 其他机电 应用

3 说明

DRV8872 器件是一款刷式直流 (BDC) 电机驱动器，适用于打印机、电器、工业设备和其他小型机器。两个逻辑输入控制 H 桥驱动器，该驱动器由四个 N 沟道金属氧化物半导体场效应晶体管 (MOSFET) 组成，能够以高达 3.6A 的峰值电流执行双向电机控制。利用电流衰减模式，可通过对输入进行脉宽调制 (PWM) 来控制电机转速。如果将两个输入均置为低电平，则电机驱动器将进入低功耗休眠模式。

DRV8872 器件 具备 集成电流调节功能。该功能基于内部基准电压以及 ISEN 引脚电压（与流经外部感测电阻的电机电流成正比）。该器件能够将电流限制在某一已知水平，这可显著降低系统功耗要求，并且无需大容量电容来维持稳定电压，尤其是在电机启动和停转时。

该器件针对故障和短路问题提供了全面保护，包括欠压锁定 (UVLO)、过流保护 (OCP) 和热关断 (TSD)。通过将 nFAULT 输出拉为低电平来报告故障。故障排除后，器件自动恢复正常状态。

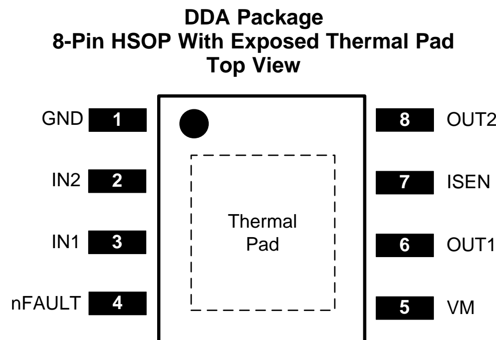
5 Pin Configuration and Functions

DDA Package
8-Pin HSOP With Exposed Thermal Pad
Top View



Pin Functions

PIN		TYPE	DESCRIPTION	
NAME	NO.			
GND	1	PWR	Logic ground	Connect to board ground.
IN1	3	I	Logic inputs	Controls the H-bridge output. Has internal pulldowns. (See 表 1.)
IN2	2			
ISEN	7	PWR	High-current ground path	If using current regulation, connect ISEN to a resistor (low-value, high-power-rating) to ground. If not using current regulation, connect ISEN directly to ground.
nFAULT	4	OD	Fault status (open-drain)	Low-level indicates UVLO, TSD, or OCP fault. Connect to a pullup resistor.
OUT1	6	O	H-bridge outputs	Connect directly to the motor, or other inductive load.
OUT2	8			
VM	5	PWR	6.5-V to 45-V power supply	Connect a 0.1-µF bypass capacitor to ground, as well as sufficient bulk capacitance, rated for the VM voltage.
PAD	—	—	Thermal pad	Connect to board ground. For good thermal dissipation, use large ground planes on multiple layers, and multiple nearby vias connecting those planes.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
Power supply voltage (VM)	–0.3	50	V
Logic input voltage (IN1, IN2)	–0.3	7	V
Fault pin (nFAULT)	–0.3	6	V
Continuous phase node pin voltage (OUT1, OUT2)	–0.7	VM + 0.7	V
Current sense input pin voltage (ISEN)(2)	–0.5	1	V
Output current (100% duty cycle)	0	3.5	A
Operating junction temperature, T_J	–40	150	°C
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Transients of ±1 V for less than 25 ns are acceptable

Copyright © 2015–2016, Texas Instruments Incorporated

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±6000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VM	Power supply voltage	6.5		45	V
V_I	Logic input voltage (IN1, IN2)	0		5.5	V
f_{PWM}	Logic input PWM frequency (IN1, IN2)	0		200[1]	kHz
I_{peak}	Peak output current[2]	0		3.6	A
T_A	Operating ambient temperature	–40		125	°C

(1) The voltages applied to the inputs should have at least 800 ns of pulse width to ensure detection. Typical devices require at least 400 ns. If the PWM frequency is 200 kHz, the usable duty cycle range is 16% to 84%
(2) Power dissipation and thermal limits must be observed

6.4 Thermal Information

THERMAL METRIC[1]		DRV8872	UNIT
		DDA (HSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	23.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	8.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	23	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

T_A = 25°C, over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY (VM)						
VM	VM operating voltage		6.5		45	V
I_{VM}	VM operating supply current	VM = 12 V		3	10	mA
$I_{VMSLEEP}$	VM sleep current	VM = 12 V			10	µA
t_{ON}	Turn-on time[1]	VM > V_{UVLO} with IN1 or IN2 high		40	50	µs
LOGIC-LEVEL INPUTS (IN1, IN2)						
V_{IL}	Input logic low voltage				0.5	V
V_{IH}	Input logic high voltage		1.5			V
V_{HYS}	Input logic hysteresis			0.5		V
I_{IL}	Input logic low current	V_{IN} = 0 V	–1		1	µA
I_{IH}	Input logic high current	V_{IN} = 3.3 V		33	100	µA
R_{PD}	Pulldown resistance	To GND		100		kΩ
t_{PD}	Propagation delay	INx to OUTx change (see 图 6)		0.7	1	µs
t_{sleep}	Time to sleep	Inputs low to sleep		1	1.5	ms
MOTOR DRIVER OUTPUTS (OUT1, OUT2)						
$R_{DS(ON)}$	High-side FET on resistance	VM = 24 V, I = 1 A, f_{PWM} = 25 kHz		307	360	mΩ
$R_{DS(ON)}$	Low-side FET on resistance	VM = 24 V, I = 1 A, f_{PWM} = 25 kHz		258	320	mΩ
t_{DEAD}	Output dead time			220		ns
V_d	Body diode forward voltage	I_{OUT} = 1 A		0.8	1	V
CURRENT REGULATION						
V_{TRIP}	ISEN voltage for current chopping		0.32	0.35	0.38	V
t_{OFF}	PWM off-time			25		µs
t_{BLANK}	PWM blanking time			2		µs
PROTECTION CIRCUITS						
V_{UVLO}	VM undervoltage lockout	VM falls until UVLO triggers		6.1	6.4	V
		VM rises until operation recovers		6.3	6.5	
$V_{UV,HYS}$	VM undervoltage hysteresis	Rising to falling threshold	100	180		mV
I_{OCP}	Overcurrent protection trip level		3.7	4.5	6.4	A
t_{OCP}	Overcurrent deglitch time			1.5		µs
t_{RETRY}	Overcurrent retry time			3		ms
T_{SD}	Thermal shutdown temperature		150	175		°C
T_{HYS}	Thermal shutdown hysteresis			40		°C
nFAULT OPEN DRAIN OUTPUT						
V_{OL}	Output low voltage	I_O = 5 mA			0.5	V
I_{OH}	Output high leakage current	V_O = 3.3 V			1	µA

(1) t_{ON} applies when the device initially powers up, and when it exits sleep mode.

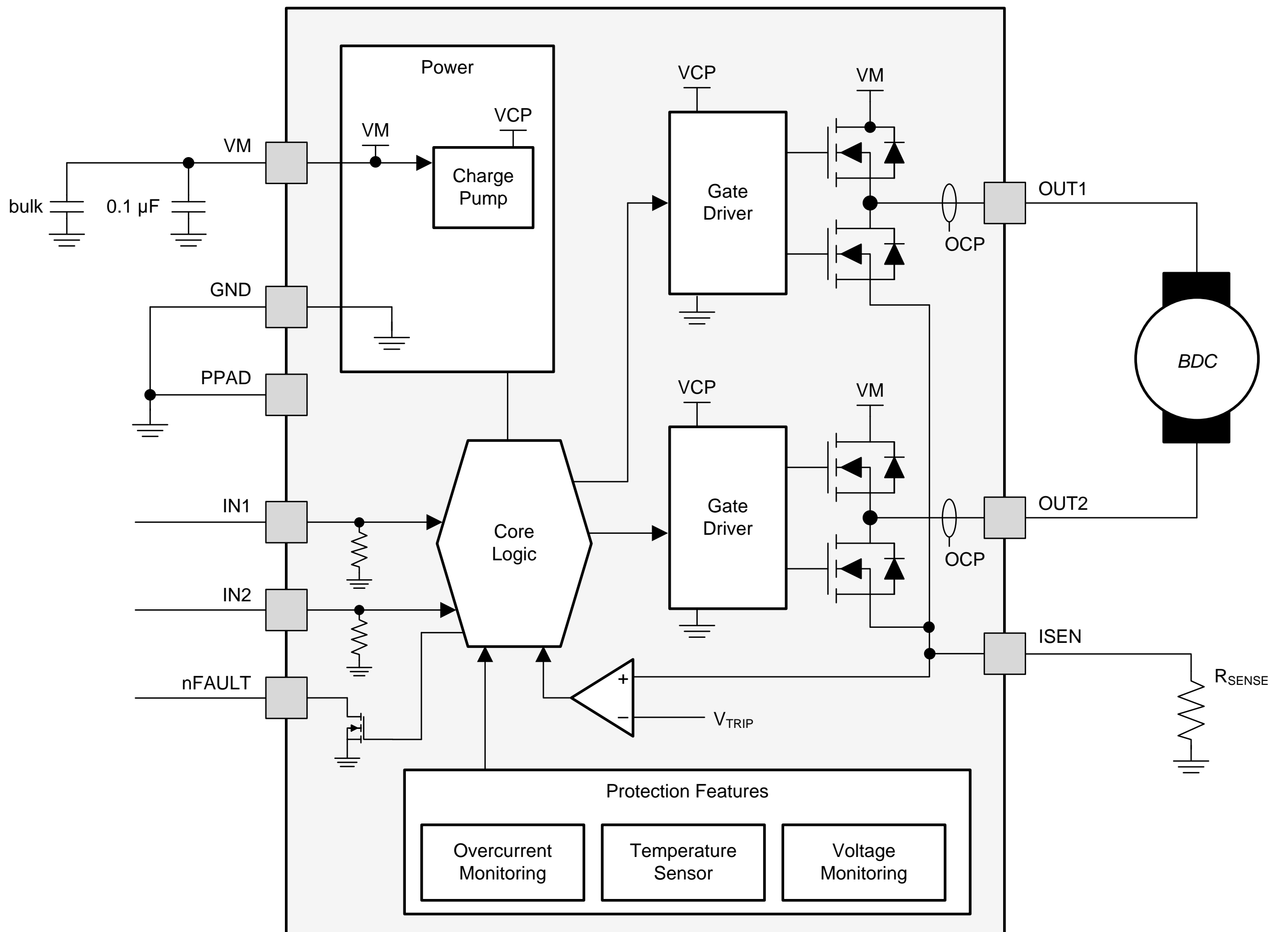
7 Detailed Description

7.1 Overview

The DRV8872 device is an optimized 8-pin device for driving brushed DC motors with 6.5 to 45 V and up to 3.6-A peak current. The integrated current regulation restricts motor current to a predefined maximum. Two logic inputs control the H-bridge driver, which consists of four N-channel MOSFETs that have a typical $R_{ds(on)}$ of 565 mΩ (including one high-side and one low-side FET). A single power input, VM, serves as both device power and the motor winding bias voltage. The integrated charge pump of the device boosts VM internally and fully enhances the high-side FETs. Motor speed can be controlled with pulse-width modulation, at frequencies between 0 to 100 kHz. The device has an integrated sleep mode that is entered by bringing both inputs low. An assortment of protection features prevent the device from being damaged if a system fault occurs.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Bridge Control

The DRV8872 output consists of four N-channel MOSFETs that are designed to drive high current. These MOSFETs are controlled by the two logic inputs IN1 and IN2, according to 表 1.

表 1. H-Bridge Control

IN1	IN2	OUT1	OUT2	DESCRIPTION
0	0	High-Z	High-Z	Coast; H-bridge disabled to High-Z (sleep entered after 1 ms)
0	1	L	H	Reverse (current OUT2 → OUT1)
1	0	H	L	Forward (current OUT1 → OUT2)
1	1	L	L	Brake; low-side slow decay

The inputs can be set to static voltages for 100% duty-cycle drive, or they can be pulse-width modulated (PWM) for variable motor speed. When using PWM, switching between driving and braking typically works best. For example, to drive a motor forward with 50% of its max RPM, IN1 = 1 and IN2 = 0 during the driving period, and IN1 = 1 and IN2 = 1 during the other period. Alternatively, the coast mode (IN1 = 0, IN2 = 0) for *fast current decay* is also available. The input pins can be powered before VM is applied.

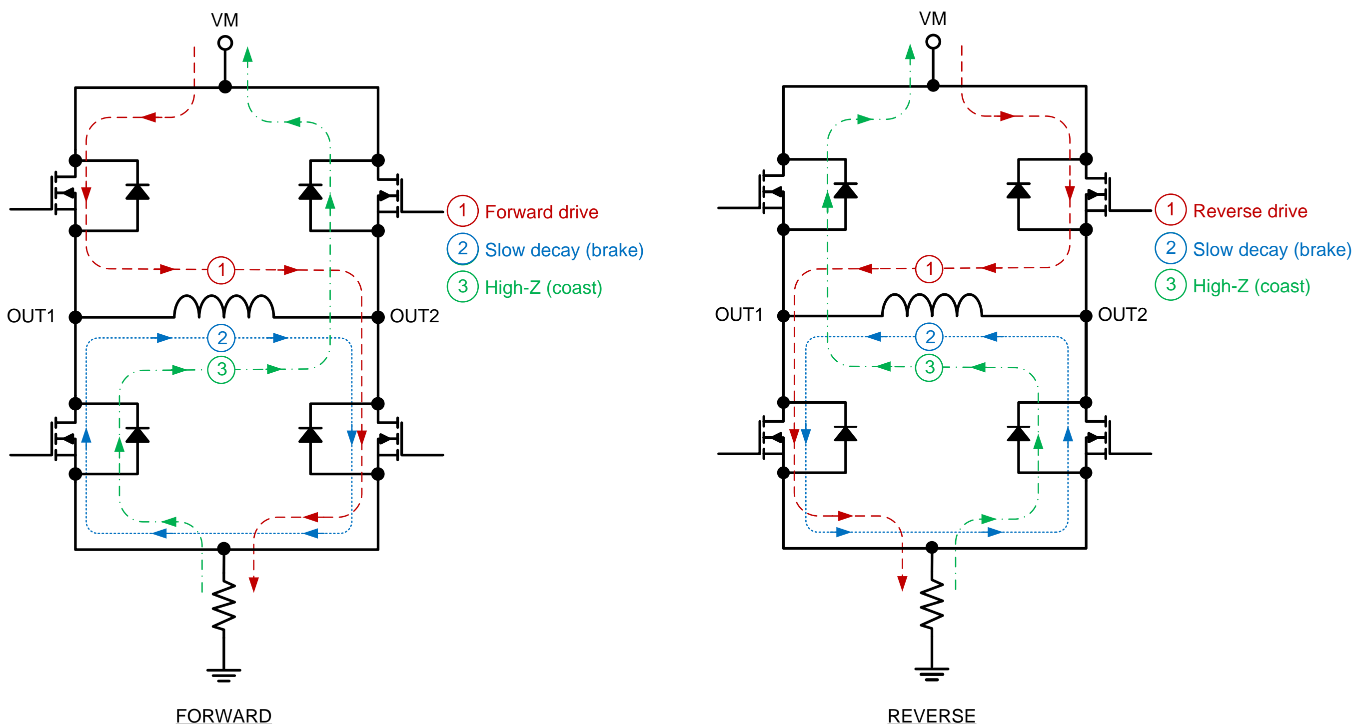


图 4. H-Bridge Current Paths

7.3.2 Sleep Mode

When IN1 and IN2 are both low for time t_{SLEEP} (typically 1 ms), the DRV8872 device enters a low-power sleep mode, where the outputs remain High-Z and the device uses $I_{VMSLEEP}$ (microamps) of current. If the device is powered up while both inputs are low, sleep mode is immediately entered. After IN1 or IN2 are high for at least 5 μs, the device is operational 50 μs (t_{ON}) later.

7.3.3 Current Regulation

The DRV8872 device limits the output current based on the resistance of an external sense resistor on pin ISEN, according to 公式 1.

版权 © 2015–2016, Texas Instruments Incorporated

$$I_{TRIP}\ (A) = \frac{V_{TRIP}\ (V)}{R_{ISEN}\ (\Omega)} = \frac{0.35\ (V)}{R_{ISEN}\ (\Omega)} \quad (1)$$

For example, if R_{ISEN} = 0.16 Ω, the DRV8872 device limits motor current to 2.2 A no matter how much load torque is applied. For guidelines on selecting a sense resistor, see the *Sense Resistor* section.

When I_{TRIP} has been reached, the device enforces slow current decay by enabling both low-side FETs, and it does this for time t_{OFF} (typically 25 µs).

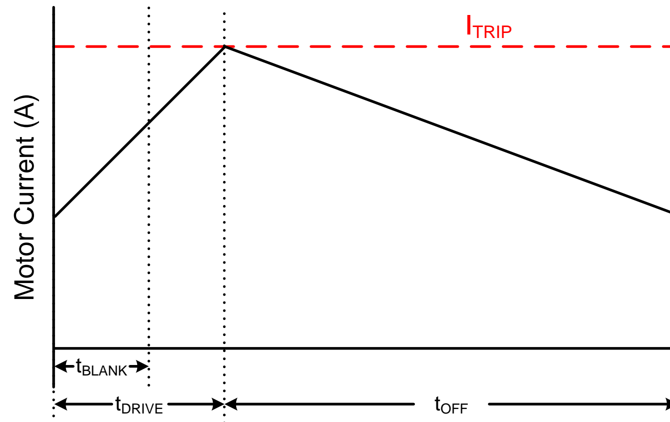

图 5. Current Regulation Time Periods

After t_{OFF} has elapsed, the output is re-enabled according to the two inputs INx. The drive time (t_{DRIVE}) until reaching another I_{TRIP} event heavily depends on the VM voltage, the back-EMF of the motor, and the inductance of the motor.

7.3.4 Dead Time

When an output changes from driving high to driving low, or driving low to driving high, dead time is automatically inserted to prevent shoot-through. t_{DEAD} is the time in the middle when the output is High-Z. If the output pin is measured during t_{DEAD}, the voltage will depend on the direction of current. If current is leaving the pin, the voltage is a diode drop below ground. If current is entering the pin, the voltage is a diode drop above VM. This diode is the body diode of the high-side or low-side FET.

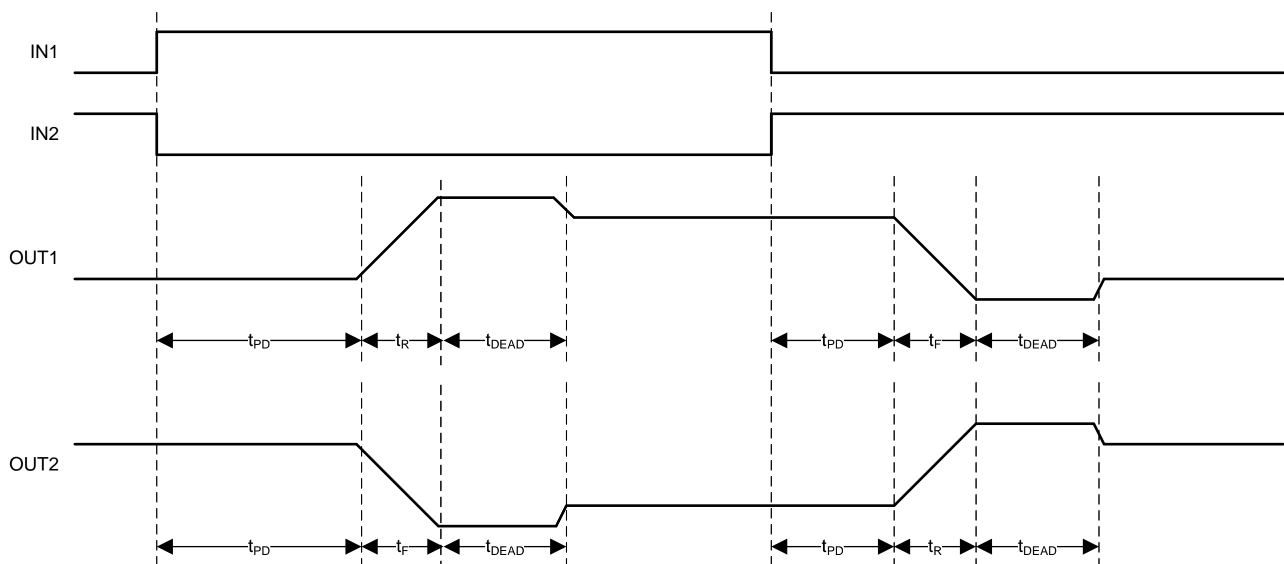

图 6. Propagation Delay Time

7.3.5 Protection Circuits

The DRV8872 device is fully protected against VM undervoltage, overcurrent, and overtemperature events. When the device is in a protected state, nFAULT is driven low. When the fault condition is removed, nFAULT becomes a high-impedance state.

7.3.5.1 VM Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage-lockout threshold voltage, all FETs in the H-bridge are disabled. Operation resumes when VM rises above the UVLO threshold.

7.3.5.2 Overcurrent Protection (OCP)

If the output current exceeds the OCP threshold I_{OCP} for longer than t_{OCP}, all FETs in the H-bridge are disabled for a duration of t_{RETRY}. After that, the H-bridge re-enables according to the state of the INx pins. If the overcurrent fault is still present, the cycle repeats; otherwise normal device operation resumes.

7.3.5.3 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge is disabled. After the die temperature has fallen to a safe level, operation automatically resumes.

表 2. Protection Functionality

FAULT	CONDITION	H-BRIDGE BECOMES	NFAULT BECOMES	RECOVERY
VM undervoltage lockout (UVLO)	VM < V_{UVLO}	Disabled	Low	VM > V_{UVLO}
Overcurrent (OCP)	I_{OUT} > I_{OCP}	Disabled	Low	t_{RETRY}
Thermal shutdown (TSD)	T_J > 150°C	Disabled	Low	$T_J < T_{SD} - T_{HYS}$

7.4 Device Functional Modes

The DRV8872 device can be used in multiple ways to drive a brushed DC motor.

7.4.1 PWM With Current Regulation

This scheme uses all of the capabilities of the device. The I_{TRIP} current is set above the normal operating current, and high enough to achieve an adequate spin-up time, but low enough to constrain current to a desired level. Motor speed is controlled by the duty cycle of one of the inputs, while the other input is static. Brake and slow decay is typically used during the off-time.

7.4.2 PWM Without Current Regulation

If current regulation is not needed, the ISEN pin should be directly connected to the PCB ground plane. This mode provides the highest possible peak current: up to 3.6 A for a few hundred milliseconds (depending on PCB characteristics and the ambient temperature). If current exceeds 3.6 A, the device might reach overcurrent protection (OCP) or over-temperature shutdown (TSD). If that occurs, the device disables and protects itself for about 3 ms (t_{RETRY}) and then resumes normal operation.

7.4.3 Static Inputs With Current Regulation

The IN1 and IN2 pins can be set high and low for 100% duty cycle drive, and ITRIP can be used to control the current, speed, and torque capability of the motor.

7.4.4 VM Control

In some systems, varying VM as a means of changing motor speed is desirable. See the *Motor Voltage* section for more information.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8872 device is typically used to drive one brushed DC motor.

8.2 Typical Application

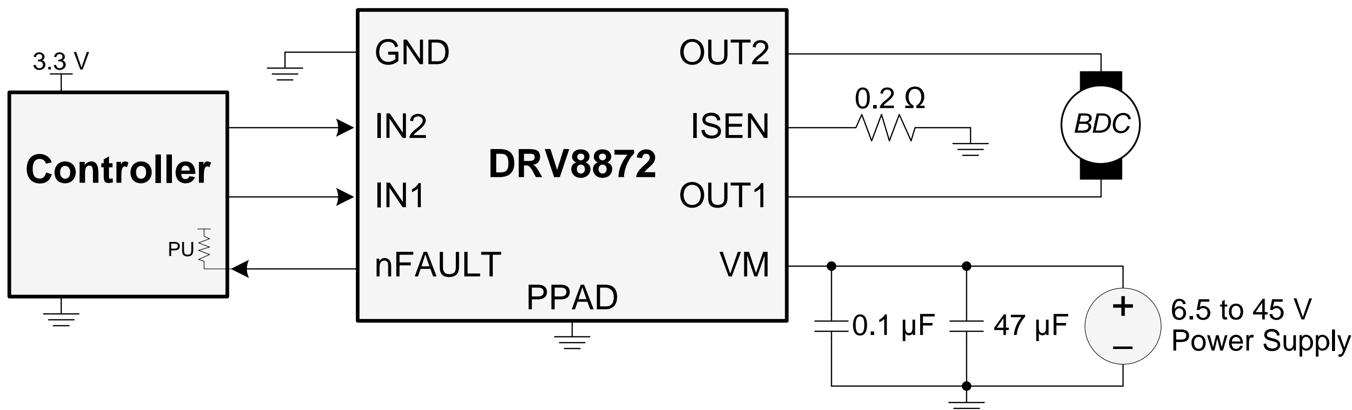

图 7. Typical Connections

8.2.1 Design Requirements

表 3 lists the design parameters.

表 3. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor voltage	V_M	24 V
Motor RMS current	I_{RMS}	0.8 A
Motor startup current	I_{START}	2 A
Motor current trip point	I_{TRIP}	2.2 A
Sense resistance	R_{ISEN}	0.16 Ω
PWM frequency	f_{PWM}	5 kHz

8.2.2 Detailed Design Procedure

8.2.2.1 Motor Voltage

The motor voltage used depends on the ratings of the motor selected and the desired RPM. A higher voltage spins a brushed DC motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

8.2.2.2 Drive Current

The current path is through the high-side sourcing DMOS power driver, motor winding, and low-side sinking DMOS power driver. Power dissipation losses in one source and sink DMOS power driver are shown in 公式 2.

$$P_D = I^2 \left(R_{DS(on)Source} + R_{DS(on)Sink}\right) \tag{2}$$

The DRV8872 device has been measured to be capable of 2-A RMS current at 25°C on standard FR-4 PCBs. The maximum RMS current varies based on the PCB design, ambient temperature, and PWM frequency. Typically, switching the inputs at 200 kHz compared to 20 kHz causes 20% more power loss in heat.

8.2.2.3 Sense Resistor

For optimal performance, the sense resistor must have the features that follow:

- Surface-mount device
- Low inductance
- Rated for high enough power
- Placed closely to the motor driver

The power dissipated by the sense resistor equals $I_{RMS}{}^{2} \times R$. For example, if peak motor current is 3 A, RMS motor current is 1.5 A, and a 0.2-Ω sense resistor is used, the resistor dissipates 1.5 A^2 × 0.2 Ω = 0.45 W. The power quickly increases with higher current levels.

Resistors typically have a rated power within some ambient temperature range, along with a derated power curve for high ambient temperatures. When a PCB is shared with other components generating heat, the system designer should add margin. It is always best to measure the actual sense resistor temperature in a final system.

Because power resistors are larger and more expensive than standard resistors, multiple standard resistors can be used in parallel, between the sense node and ground. This configuration distributes the current and heat dissipation.

9 Power Supply Recommendations

9.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. More bulk capacitance is generally beneficial but with the disadvantages of increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power supply's capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system limits the rate that the current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

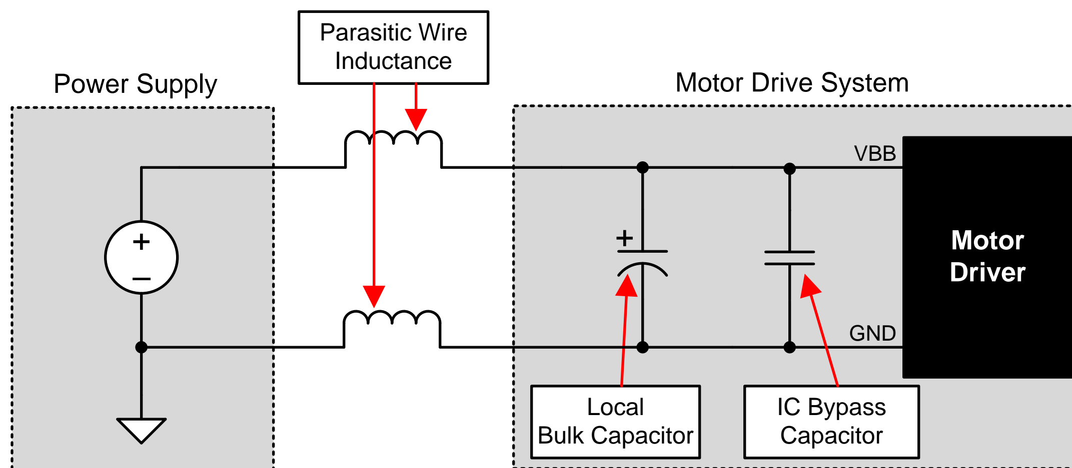

图 14. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

版权 © 2015–2016, Texas Instruments Incorporated

10 Layout

10.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors should be ceramic, and placed closely to device pins.

The high-current device outputs should use wide metal traces.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias help dissipate the $I^2 \times R_{DS(on)}$ heat that is generated in the device.

图 15 shows the recommended layout and component placement.

10.2 Layout Example

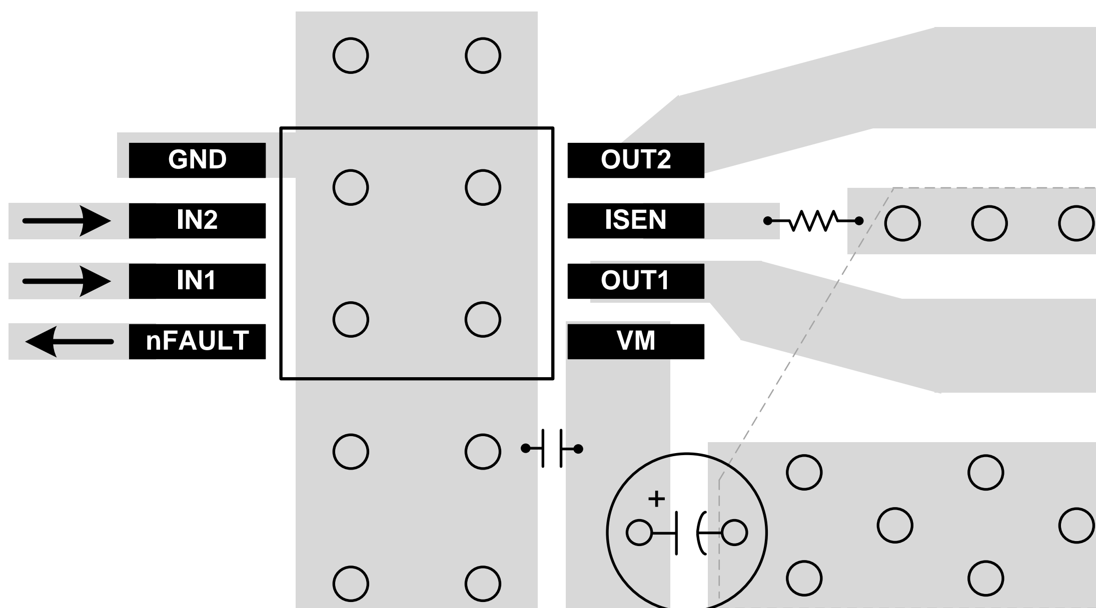

图 15. Layout Recommendation

10.3 Thermal Considerations

The DRV8872 device has thermal shutdown (TSD) as described in the *Thermal Shutdown (TSD)* section. If the die temperature exceeds approximately 175°C, the device is disabled until the temperature drops below the temperature hysteresis level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high of an ambient temperature.

10.4 Power Dissipation

Power dissipation in the DRV8872 device is dominated by the power dissipated in the output FET resistance, $R_{DS(on)}$. Use 公式 2 from the *Drive Current* section to calculate the estimated average power dissipation of when driving a load.

Note that at startup, the output current is much higher than normal running current; this peak current and its duration must be also be considered.

Power Dissipation (接下页)

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

注

$R_{DS(on)}$ increases with temperature, so as the device heats, the power dissipation increases. This fact must be taken into consideration when sizing the heatsink.

The power dissipation of the DRV8872 is a function of RMS motor current and the FET resistance ($R_{DS(ON)}$) of each output.

$$\text{Power} \approx I_{RMS}{}^2 \times \left(\text{High-side } R_{DS(ON)} + \text{ Low-side } R_{DS(ON)}\right) \quad (3)$$

For this example, the ambient temperature is 58°C, and the junction temperature reaches 80°C. At 58°C, the sum of $R_{DS(ON)}$ is about 0.72 Ω. With an example motor current of 0.8 A, the dissipated power in the form of heat is $0.8\ A^2 \times 0.72\ \Omega = 0.46\ W$.

The temperature that the DRV8872 reaches depends on the thermal resistance to the air and PCB. Soldering the device PowerPAD to the PCB ground plane, with vias to the top and bottom board layers, is important to dissipate heat into the PCB and reduce the device temperature. In the example used here, the DRV8872 had an effective thermal resistance $R_{\theta JA}$ of 48°C/W, and a T_J value as shown in 公式 4.

$$T_J = T_A + (P_D \times R_{\theta JA}) = 58°C + (0.46\ W \times 48°C/W) = 80°C \quad (4)$$

10.4.1 Heatsinking

The PowerPAD package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this connection can be accomplished by adding a number of vias to connect the thermal pad to the ground plane.

On PCBs without internal planes, a copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, refer to the TI application report, *PowerPAD™ Thermally Enhanced Package* (SLMA002), and the TI application brief, *PowerPAD Made Easy™* (SLMA004), available at www.ti.com. In general, the more copper area that can be provided, the more power can be dissipated.

TI E2E™ Online Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support ***TI's Design Support*** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 商标

PowerPAD, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。 精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

11.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8872DDA	ACTIVE	SO PowerPAD	DDA	8	75	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	8872	Samples
DRV8872DDAR	ACTIVE	SO PowerPAD	DDA	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	8872	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

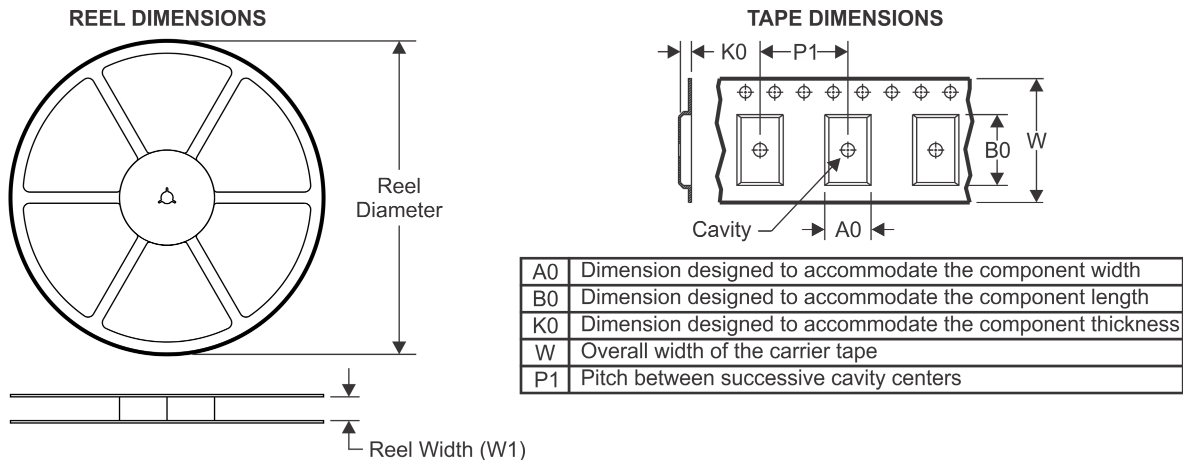
(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

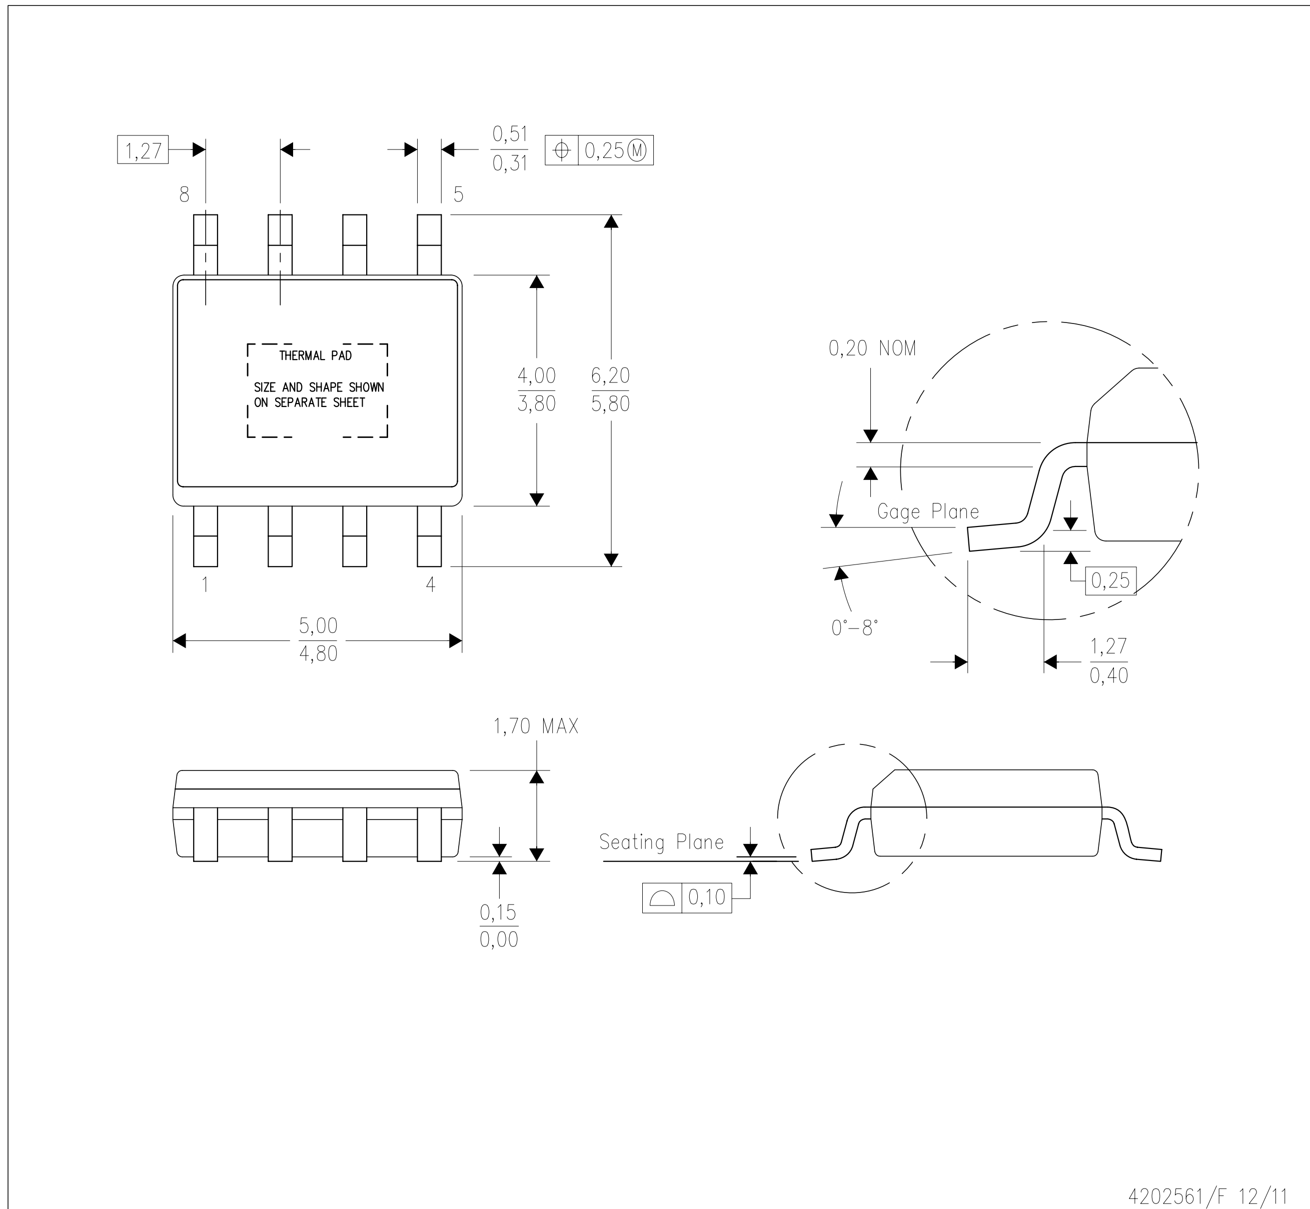
DDA (R-PDSO-G8) PowerPAD™ PLASTIC SMALL-OUTLINE



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5–1994.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. This package complies to JEDEC MS-012 variation BA

PowerPAD is a trademark of Texas Instruments.

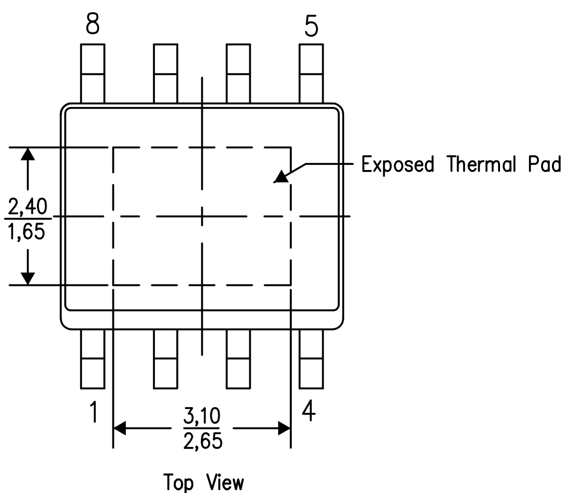
DDA (R-PDSO-G8) PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.



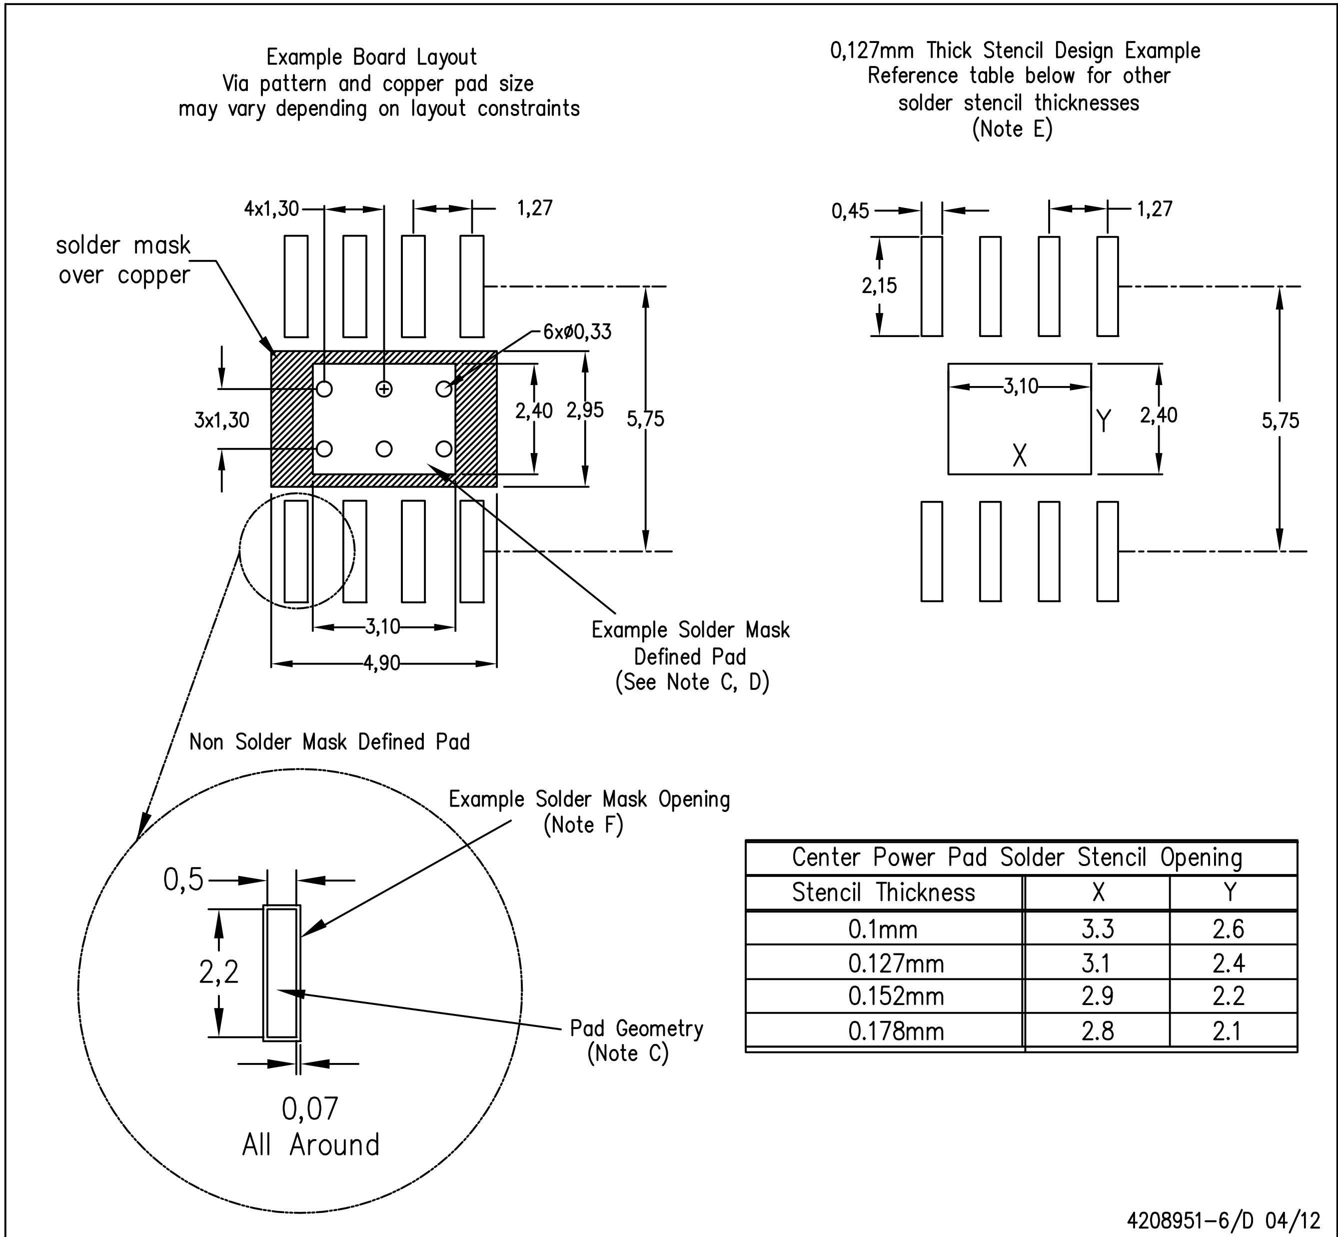
Exposed Thermal Pad Dimensions

4206322-6/L 05/12

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

DDA (R–PDSO–G8) PowerPAD™ PLASTIC SMALL OUTLINE



Center Power Pad Solder Stencil Opening		
Stencil Thickness	X	Y
0.1mm	3.3	2.6
0.127mm	3.1	2.4
0.152mm	2.9	2.2
0.178mm	2.8	2.1

NOTES:
- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Publication IPC–7351 is recommended for alternate designs.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http: //www.ti.com>. Publication IPC–7351 is recommended for alternate designs.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
- F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (http://www.ti.com/sc/docs/stdterms.htm) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权 负责并确保 应用的安全性， 及设计人员的 应用 （包括应用中使用的所有 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的 应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何 应用前， 将彻底测试该等 应用和 该等应用中所用 TI 产品的 功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的 应用， 如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的 应用时， 才被授权使用、复制和修改任何相关单项 TI 资源。但并未依据禁止反言原则或其他法理授予您任何TI知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等产权包括但不限于任何专利权、版权、屏蔽作品权或与使用TI产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默认的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的 符合 相关功能安全标准和要求的应用。在应用内使用产品的行为本身不会 配有 任何安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和 标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的 产品， 并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
