

enCoRe™ V Low Voltage Microcontroller

Features

■ Powerful Harvard Architecture Processor

- M8C processor speeds running up to 24 MHz
- Low power at high processing speeds
- Interrupt controller
- 1.71V to 3.6V operating voltage
- Temperature range: 0°C to 70°C

■ Flexible On-Chip Memory

- Up to 32K Flash program storage
50,000 Erase/write cycles
- Up to 2048 bytes SRAM data storage
- Flexible protection modes
- In-System Serial Programming (ISSP)

■ Complete Development Tools

- Free development tool (PSoc Designer™)
- Full featured, in-circuit emulator and programmer
- Full speed emulation
- Complex breakpoint structure
- 128K trace memory

■ Precision, Programmable Clocking

- Crystal-less oscillator with support for an external crystal or resonator
- Internal $\pm 5.0\%$ 6, 12, or 24 MHz main oscillator
- Internal low speed oscillator at 32 kHz for watchdog and sleep. The frequency range is 19–50 kHz with a 32 kHz typical value

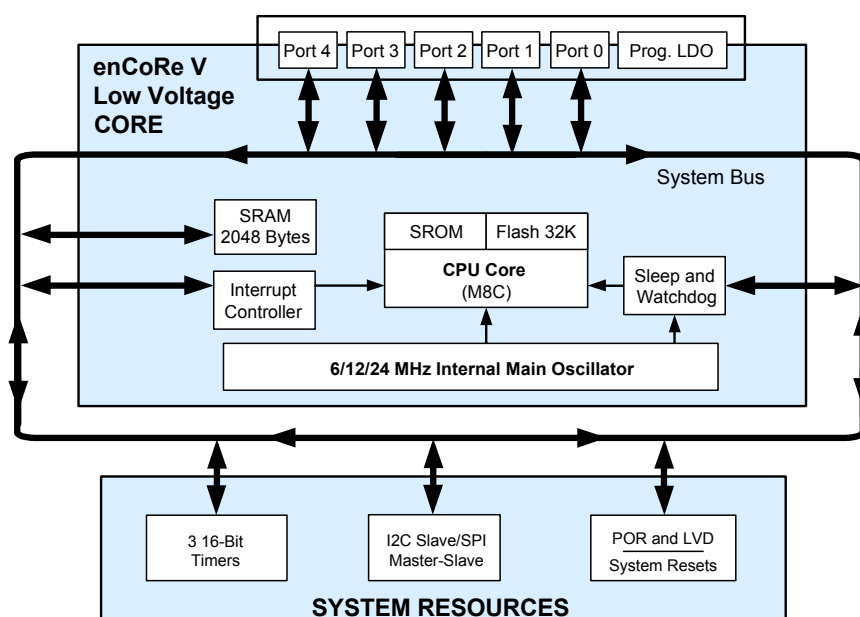

■ Programmable Pin Configurations

- 25 mA sink current on all GPIO
- Pull Up, High Z, Open Drain, CMOS drive modes on all GPIO
- Configurable inputs on all GPIO
- Low dropout voltage regulator for Port 1 pins. Programmable to output 3.0, 2.5, or 1.8V at the I/O pins
 - Configurable input threshold for Port 1
 - 3.0V, 20 mA total Port 1 source current
 - Hot-swappable
- 5 mA strong drive mode on Ports 0 and 1

■ Additional System Resources

- Configurable communication speeds
- I²C™ Slave
 - Selectable to 50 kHz, 100 kHz, or 400 kHz
 - Implementation requires no clock stretching
 - Implementation during sleep modes with less than 100 mA
 - Hardware address detection
- SPI™ master and SPI slave
 - Configurable between 93.75 kHz and 12 MHz
- Three 16-bit timers
- 8-bit ADC used to monitor battery voltage or other signals - with external components
- Watchdog and sleep timers
- Integrated supervisory circuit

enCoRe V LV Block Diagram

Functional Overview

The enCoRe V LV family of devices are designed to replace multiple traditional low voltage microcontroller system components with one, low cost single chip programmable component. Communication peripherals (I2C/SPI), a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts.

The architecture for this device family, as illustrated in enCoRe V LV Block Diagram, is comprised of two main areas: the CPU core and the system resources. Depending on the enCoRe V LV package, up to 36 general purpose IO (GPIO) are also included.

Enhancements over the Cypress' legacy low voltage microcontrollers include faster CPU at lower voltage operation, lower current consumption, twice the RAM and Flash, hot-swappable IOs, I2C hardware address recognition, new very low current sleep mode, and new package options.

The enCoRe V LV Core

The enCoRe V LV Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO (internal main oscillator) and ILO (internal low speed oscillator). The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a four-MIPS, 8-bit Harvard architecture microprocessor.

System Resources provide additional capability, such as a configurable I2C slave and SPI master-slave communication interface and various system resets supported by the M8C.

Additional System Resources

System Resources, some of which have been previously listed, provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. Brief statements describing the merits of each system resource are presented below.

- 10-bit on-chip ADC shared between System Performance manager (used to calculate parameters based on temperature for flash write operations) and the user.
- The I2C slave and SPI master-slave module provides 50, 100, or 400 kHz communication over two wires. SPI communication over 3 or 4 wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- In I2C slave mode the hardware address recognition feature reduces the already low power consumption by eliminating the need for CPU intervention until a packet addressed to the target device has been received.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.

- The 5V maximum input, 1.8, 2.5, or 3V selectable output, low dropout regulator (LDO) provides regulation for IOs. A register controlled bypass mode allows the user to disable the LDO.
- Standard Cypress PSoC IDE tools are available for debugging the enCoRe V LV family of parts.

Getting Started

The quickest path to understanding the PSoC silicon is by reading this data sheet and using the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications. For in-depth information, along with detailed programming information, reference the *PSoC Mixed-Signal Array Technical Reference Manual*, which can be found on <http://www.cypress.com/psoc>.

For up-to-date Ordering, Packaging, and Electrical Specification information, reference the latest PSoC device data sheets on the web at <http://www.cypress.com>.

Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store contains development kits, C compilers, and all accessories for PSoC development. Go to the Cypress Online Store web site at <http://www.cypress.com/shop/>. Under Product Categories click PSoC® Mixed Signal Arrays to view a current list of available items.

Technical Training Modules

Free PSoC technical training modules are available for users new to PSoC. Training modules cover designing, debugging, advanced analog and CapSense. Go to <http://www.cypress.com/techtrain>.

Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to <http://www.cypress.com>, click on Support located at the top of the web page, and select CYPros Consultants.

Technical Support

PSoC application engineers take pride in fast and accurate response. They can be reached with a four hour guaranteed response at <http://www.cypress.com/support>.

Application Notes

A long list of application notes assists you in every aspect of your design effort. To view the PSoC application notes, go to the <http://www.cypress.com> web site and select Application Notes under the Documentation list located at the top of the web page.

Development Tools

PSoC Designer™ is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows XP and Windows Vista.

This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and built-in support for third-party assemblers and C compilers.

PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family.

PSoC Designer Software Subsystems

System-Level View

The system-level view is a drag-and-drop visual embedded system design environment based on PSoC Express. In this view you solve design problems the same way you might think about the system. Select input and output devices based upon system requirements. Add a communication interface and define the interface to the system (registers). Define when and how an output device changes state based upon any/all other system devices. Based upon the design, PSoC Designer automatically selects one or more PSoC Mixed-Signal Controllers that match your system requirements.

PSoC Designer generates all embedded code, then compiles and links it into a programming file for a specific PSoC device.

Chip-Level View

The chip-level view is a more traditional integrated development environment (IDE) based on PSoC Designer 4.x. You choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. You configure the user modules for your chosen application and connect them to each other and to the proper pins. Then you generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows for changing configurations at run time.

Hybrid Designs

You can begin in the system-level view, allow it to choose and configure your user modules, routing, and generate code, then switch to the chip-level view to gain complete control over on-chip resources. All views of the project share common code editor, builder, and common debug, emulation, and programming tools.

Code Generation Tools

PSoC Designer supports multiple third-party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

Assemblers. The assemblers allow assembly code to be merged seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices.

The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear break-points, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions.

The PSoC development process can be summarized in the following four steps:

1. Select Components
2. Configure Components
3. Organize and Connect
4. Generate, Verify, and Debug

Select Components

Both the system-level and chip-level views provide a library of pre-built, pre-tested hardware peripheral components. In the system-level view these components are called “drivers” and correspond to inputs (a thermistor, for example), outputs (a brushless DC fan, for example), communication interfaces (I²C-bus, for example), and the logic to control how they interact with one another (called valuator).

In the chip-level view the components are called “user modules.” User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and mixed-signal varieties.

Configure Components

Each of the components you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a Pulse Width Modulator (PWM) User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus.

Both the system-level drivers and chip-level user modules are documented in data sheets that are viewed directly in PSoC Designer. These data sheets explain the internal operation of the component and provide performance specifications. Each data sheet describes the use of each user module parameter or driver property, and other information you may need to successfully implement your design.

Organize and Connect

You build signal chains at the chip level by interconnecting user modules to each other and the IO pins, or connect system-level inputs, outputs, and communication interfaces to each other with valuator functions.

In the system-level view selecting a potentiometer driver to control a variable speed fan driver and setting up the valuator to control the fan speed based on input from the pot selects, places, routes, and configures a programmable gain amplifier (PGA) to buffer the input from the potentiometer, an analog-to-digital converter (ADC) to convert the potentiometer's output to a digital signal, and a PWM to control the fan.

In the chip-level view, you perform the selection, configuration, and routing so that you have complete control over the use of all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Configuration Files” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system.

Both system-level and chip-level designs generate software based on your design. The chip-level design provides application programming interfaces (APIs) with high-level functions to control and respond to hardware events at run time and interrupt service routines that you can adapt as needed. The system-level design also generates a C main() program that completely controls the chosen application and contains placeholders for custom code at strategic positions allowing you to further refine the software without disrupting the generated code.

A complete code development environment allows you to develop and customize your applications in C, assembly language, or both.

The last step in the development process takes place inside PSoC Designer's Debugger (access by clicking the Connect icon). PSoC Designer downloads the HEX image to the In-Circuit Emulator (ICE) where it runs at full speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the debug interface provides a large trace buffer and allows you to define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Document Conventions

Acronyms Used

The following table lists the acronyms that are used in this document.

Acronym	Description
API	application programming interface
CPU	central processing unit
GPIO	general purpose IO
GUI	graphical user interface
ICE	in-circuit emulator
ILO	internal low speed oscillator
IMO	internal main oscillator
IO	input/output
LSb	least significant bit
LVD	low voltage detect
MSb	most significant bit
POR	power on reset
PPOR	precision power on reset
PSoC®	Programmable System-on-Chip™
SLIMO	slow IMO
SRAM	static random access memory

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 6 on page 13](#) lists all the abbreviations used to measure the enCoRe V LV devices.

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

Pin Configuration

32-Pin Part Pinout

Register Reference

The section discusses the registers of the enCoRe V LV device. It lists all the registers in mapping tables, in address order.

Register Conventions

The register conventions specific to this section are listed in the following table.

Table 3. Register Conventions

Convention	Description
R	Read register or bits
W	Write register or bits
O	Only a read/write register or bits
L	Logical register or bits
C	Clearable register or bits
#	Access is bit specific

Register Mapping Tables

The enCoRe V LV device has a total register address space of 512 bytes. The register space is also referred to as IO space and is broken into two parts: Bank 0 (user space) and Bank 1 (configuration space). The XIO bit in the Flag register (CPU_F) determines which bank the user is currently in. When the XIO bit is set, the user is said to be in the “extended” address space or the “configuration” registers.

Table 4. Register Map Bank 0 Table: User Space

Electrical Specifications

This section presents the DC and AC electrical specifications of the enCoRe V LV devices. For the most up to date electrical specifications, verify that you have the most recent data sheet available by visiting the company web site at <http://www.cypress.com>.

Figure 3. Voltage versus CPU Frequency

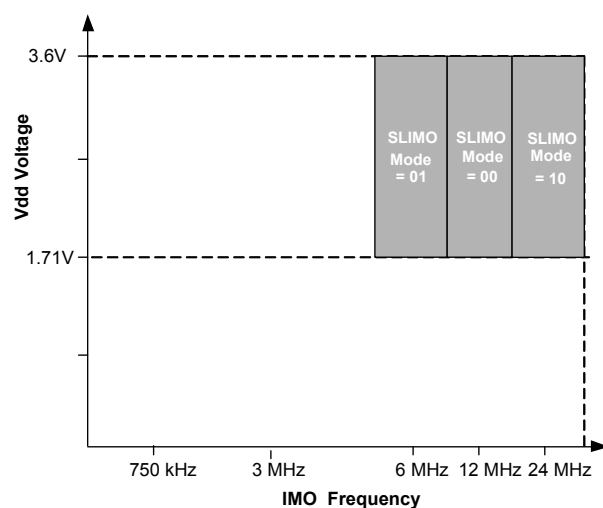

Figure 4. IMO Frequency Trim Options

The following table lists the units of measure that are used in this chapter.

Table 6. Units of Measure

Symbol	Unit of Measure	Symbol	Unit of Measure
°C	degree Celsius	μW	microwatts
dB	decibels	mA	milli-ampere
fF	femto farad	ms	milli-second
Hz	hertz	mV	milli-volts
KB	1024 bytes	nA	nanoampere
Kbit	1024 bits	ns	nanosecond
kHz	kilohertz	nV	nanovolts
kΩ	kilohm	Ω	ohm
MHz	megahertz	pA	picoampere
MΩ	megaohm	pF	picofarad
μA	microampere	pp	peak-to-peak
μF	microfarad	ppm	parts per million
μH	microhenry	ps	picosecond
μs	microsecond	sps	samples per second
μV	microvolts	s	sigma: one standard deviation
μVrms	microvolts root-mean-square	V	volts

ADC Electrical Specifications
Table 7. ADC Electrical Specifications

Symbol	Description	Min	Typ	Max	Units	Conditions
	Input					
	Input Voltage Range	Vss		1.3	Volts	This gives 72% of maximum code
	Input Capacitance			5	pF	
	Resolution	8		10	Bits	Settings 8, 9, or 10
	8-Bit Sample Rate		23.4375		ksps	Data Clock set to 6 MHz. Sample Rate = $0.001/(2^{\text{Resolution}}/\text{Data clock})$
	10-Bit Sample Rate		5.859		ksps	Data Clock set to 6 MHz. Sample Rate = $0.001/(2^{\text{Resolution}}/\text{Data clock})$
	DC Accuracy					
	DNL	-1		+2	LSB	For any configuration
	INL	-2		+2	LSB	For any configuration
	Offset Error	0	15	90	mV	
	Operating Current		275	350	μA	
	Data Clock	2.25		12	MHz	Source is chip's internal main oscillator. See device data sheet of accuracy.
	Monotonicity					Not guaranteed. See DNL
	Power Supply Rejection Ration					
	PSRR (Vdd>3.0V)		24	dB		
	PSRR (2.2 < Vdd < 3.0)		30	dB		
	PSRR (2.0 < Vdd < 2.2)		12	dB		
	PSRR (Vdd < 2.0)		0	dB		
	Gain Error	1		5	%FSR	For any resolution
	Input Resistance	$1/(500\text{fF} \cdot \text{Data-Clock})$	$1/(400\text{fF} \cdot \text{Data-Clock})$	$1/(300\text{fF} \cdot \text{Data-Clock})$	Ω	Equivalent switched cap input resistance for 8-, 9-, or 10-bit resolution.

Electrical Characteristics

Absolute Maximum Ratings

Storage Temperature (T_{STG}) ⁽³⁾	-55°C to 125°C (Typical +25°C)
Supply Voltage Relative to Vss (Vdd)	-0.5V to +4.0V
DC Input Voltage (V_{IO})	Vss - 0.5V to Vdd + 0.5V
DC Voltage Applied to Tri-state (V_{IOZ})	Vss - 0.5V to Vdd + 0.5V
Maximum Current into any Port Pin (I_{MIO})	-25mA to +50 mA
Electro Static Discharge Voltage (ESD) ⁽⁴⁾	2000V
Latch-up Current (LU) ⁽⁵⁾	200 mA

Operating Conditions

Ambient Temperature (T_A)	0°C to 70°C
Operational Die Temperature (T_J) ⁽⁶⁾	0°C to 85°C

DC Electrical Characteristics

DC Chip Level Specifications

Table 8 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 8. DC Chip Level Specifications

Parameter	Description	Conditions	Min	Typ	Max	Units
Vdd	Supply Voltage	See table titled DC POR and LVD Specifications on page 19 .	1.71	–	3.6	V
I_{DD24}	Supply Current, IMO = 24 MHz	Conditions are Vdd = 3.0V, T_A = 25°C, CPU = 24 MHz No I2C/SPI	–	–	3.1	mA
I_{DD12}	Supply Current, IMO = 12 MHz	Conditions are Vdd = 3.0V, T_A = 25°C, CPU = 12 MHz No I2C/SPI	–	–	2.0	mA
I_{DD6}	Supply Current, IMO = 6 MHz	Conditions are Vdd = 3.0V, T_A = 25°C, CPU = 6 MHz No I2C/SPI	–	–	1.5	mA
I_{SB0}	Deep Sleep Current	Vdd = 3.0V, T_A = 25°C, IO regulator turned off	–	0.1	–	μA
I_{SB1}	Standby Current with POR, LVD, and Sleep Timer	Vdd = 3.0V, T_A = 25°C, IO regulator turned off	–	–	1.5	μA

Notes

- Higher storage temperatures reduce data retention time. Recommended storage temperature is +25°C ± 25°C. Extended duration storage temperatures above 85°C degrade reliability.
- Human Body Model ESD.
- According to JESD78 standard.
- The temperature rise from ambient to junction is package specific. See [Thermal Impedances on page 26](#). The user must limit the power consumption to comply with this requirement.

DC General Purpose IO Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 1.71V to 3.6V and $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$. Typical parameters apply to 3.3V at 25°C . These are for design guidance only.

Table 9. 3.0V to 3.6V DC GPIO Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
R_{PU}	Pull Up Resistor		4	5.6	8	$k\Omega$
V_{OH1}	High Output Voltage Port 2 or 3 Pins	$I_{OH} \leq 10 \mu\text{A}$, maximum of 10 mA source current in all IOs	$V_{DD} - 0.2$	—	—	V
V_{OH2}	High Output Voltage Port 2 or 3 Pins	$I_{OH} = 1 \text{ mA}$, maximum of 20 mA source current in all IOs	$V_{DD} - 0.9$	—	—	V
V_{OH3}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	$I_{OH} < 10 \mu\text{A}$, maximum of 10 mA source current in all IOs	$V_{DD} - 0.2$	—	—	V
V_{OH4}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	$I_{OH} = 5 \text{ mA}$, maximum of 20 mA source current in all IOs	$V_{DD} - 0.9$	—	—	V
V_{OH5}	High Output Voltage Port 1 Pins with LDO Regulator Enabled for 3V Out	$I_{OH} < 10 \mu\text{A}$, $V_{DD} > 3.1\text{V}$, maximum of 4 IOs all sourcing 5 mA	2.85	3.00	3.3	V
V_{OH6}	High Output Voltage Port 1 Pins with LDO Regulator Enabled for 3V Out	$I_{OH} = 5 \text{ mA}$, $V_{DD} > 3.1\text{V}$, maximum of 20 mA source current in all IOs	2.20	—	—	V
V_{OH7}	High Output Voltage Port 1 Pins with LDO Enabled for 2.5V Out	$I_{OH} < 10 \mu\text{A}$, $V_{DD} > 2.7\text{V}$, maximum of 20 mA source current in all IOs	2.35	2.50	2.75	V
V_{OH8}	High Output Voltage Port 1 Pins with LDO Enabled for 2.5V Out	$I_{OH} = 2 \text{ mA}$, $V_{DD} > 2.7\text{V}$, maximum of 20 mA source current in all IOs	1.90	—	—	V
V_{OH9}	High Output Voltage Port 1 Pins with LDO Enabled for 1.8V Out	$I_{OH} < 10 \mu\text{A}$, $V_{DD} > 2.7\text{V}$, maximum of 20 mA source current in all IOs	1.60	1.80	2.1	V
V_{OH10}	High Output Voltage Port 1 Pins with LDO Enabled for 1.8V Out	$I_{OH} = 1 \text{ mA}$, $V_{DD} > 2.7\text{V}$, maximum of 20 mA source current in all IOs	1.20	—	—	V
V_{OL}	Low Output Voltage	$I_{OL} = 25 \text{ mA}$, $V_{DD} > 3.3\text{V}$, maximum of 60 mA sink current on even port pins (for example, P0[2] and P1[4]) and 60 mA sink current on odd port pins (for example, P0[3] and P1[5])	—	—	0.75	V
V_{IL}	Input Low Voltage		—	—	0.80	V
V_{IH}	Input High Voltage		2.00	—	—	V
V_H	Input Hysteresis Voltage		—	80	—	mV
I_{IL}	Input Leakage (Absolute Value)		—	0.001	1	μA
C_{PIN}	Pin Capacitance	Package and pin dependent Temp = 25°C	0.5	1.7	5	pF

Table 10. 2.4V to 3.0V DC GPIO Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
R _{PU}	Pull Up Resistor		4	5.6	8	kΩ
V _{OH1}	High Output Voltage Port 2 or 3 Pins	IOH < 10 μA, maximum of 10 mA source current in all IOs	Vdd - 0.2	–	–	V
V _{OH2}	High Output Voltage Port 2 or 3 Pins	IOH = 0.2 mA, maximum of 10 mA source current in all IOs	Vdd - 0.4	–	–	V
V _{OH3}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	IOH < 10 μA, maximum of 10 mA source current in all IOs	Vdd - 0.2	–	–	V
V _{OH4}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	IOH = 2 mA, maximum of 10 mA source current in all IOs	Vdd - 0.5	–	–	V
V _{OH5A}	High Output Voltage Port 1 Pins with LDO Enabled for 1.8V Out	IOH < 10 μA, Vdd > 2.4V, maximum of 20 mA source current in all IOs.	1.50	1.80	2.10	V
V _{OH6A}	High Output Voltage Port 1 Pins with LDO Enabled for 1.8V Out	IOH = 1 mA, Vdd > 2.4V, maximum of 20 mA source current in all IOs	1.20	–	–	V
V _{OL}	Low Output Voltage	IOL = 10 mA, maximum of 30 mA sink current on even port pins (for example, P0[2] and P1[4]) and 30 mA sink current on odd port pins (for example, P0[3] and P1[5])	–	–	0.75	V
V _{IL}	Input Low Voltage		–	–	0.72	V
V _{IH}	Input High Voltage		1.6	–		V
V _H	Input Hysteresis Voltage		–	80	–	mV
I _{IL}	Input Leakage (Absolute Value)		–	0.001	1	μA
C _{PIN}	Capacitive Load on Pins	Package and pin dependent Temp = 25°C	0.5	1.7	5	pF

Table 11. 1.71V to 2.4V DC GPIO Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
R _{PU}	Pull Up Resistor		4	5.6	8	kΩ
V _{OH1}	High Output Voltage Port 2 or 3 Pins	IOH = 10 μA, maximum of 10 mA source current in all IOs	Vdd - 0.2	–	–	V
V _{OH2}	High Output Voltage Port 2 or 3 Pins	IOH = 0.5 mA, maximum of 10 mA source current in all IOs	Vdd - 0.5	–	–	V
V _{OH3}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	IOH = 100 μA, maximum of 10 mA source current in all IOs	Vdd - 0.2	–	–	V
V _{OH4}	High Output Voltage Port 0 or 1 Pins with LDO Regulator Disabled for Port 1	IOH = 2 mA, maximum of 10 mA source current in all IOs	Vdd - 0.5	–	–	V
V _{OL}	Low Output Voltage	IOL = 5 mA, maximum of 20 mA sink current on even port pins (for example, P0[2] and P1[4]) and 30 mA sink current on odd port pins (for example, P0[3] and P1[5])	–	–	0.4	V
V _{IL}	Input Low Voltage		–	–	0.3 x Vdd	V
V _{IH}	Input High Voltage		0.65 x Vdd	–		V
V _H	Input Hysteresis Voltage		–	80	–	mV
I _{IL}	Input Leakage (Absolute Value)		–	0.001	1	μA
C _{PIN}	Capacitive Load on Pins	Package and pin dependent. Temp = 25°C	0.5	1.7	5	pF

DC POR and LVD Specifications

Table 12 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 12. DC POR and LVD Specifications

Symbol	Description	Min	Typ	Max	Units
V _{PPOR0}	Vdd Value for PPOR Trip ⁽⁷⁾	1.61	1.66	1.71	V
V _{PPOR1}	PORLEV[1:0] = 00b, HPOR = 0		2.36	2.41	V
V _{PPOR2}	PORLEV[1:0] = 00b, HPOR = 1		2.60	2.66	V
V _{PPOR3}	PORLEV[1:0] = 01b, HPOR = 1		2.82	2.95	V
V _{LVD0}	Vdd Value for LVD Trip				
V _{LVD1}	VM[2:0] = 000b ⁽⁸⁾	2.40	2.45	2.51	V
V _{LVD2}	VM[2:0] = 001b ⁽⁹⁾	2.64	2.71	2.78	V
V _{LVD3}	VM[2:0] = 010b ⁽¹⁰⁾	2.85	2.92	2.99	V
V _{LVD4}	VM[2:0] = 011b	2.95	3.02	3.09	V
V _{LVD5}	VM[2:0] = 100b	3.06	3.13	3.20	V
V _{LVD6}	VM[2:0] = 101b	1.84	1.9	2.32	V
	VM[2:0] = 110b ⁽¹¹⁾	1.75	1.8	1.84	V

DC Programming Specifications

Table 13 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 13. DC Programming Specifications

Symbol	Description	Min	Typ	Max	Units
V _{ddIWRITE}	Supply Voltage for Flash Write Operations	1.71	—	—	V
I _{DDP}	Supply Current During Programming or Verify	—	5	25	mA
V _{ILP}	Input Low Voltage During Programming or Verify	—	—	V _{IL}	V
V _{IHP}	Input High Voltage During Programming or Verify	V _{IH}	—	—	V
I _{ILP}	Input Current when Applying Vilp to P1[0] or P1[1] During Programming or Verify ⁽¹²⁾	—	—	0.2	mA
I _{IHP}	Input Current when Applying Vihp to P1[0] or P1[1] During Programming or Verify ⁽¹²⁾	—	—	1.5	mA
V _{OLV}	Output Low Voltage During Programming or Verify	—	—	V _{ss} + 0.75	V
V _{OHV}	Output High Voltage During Programming or Verify	V _{OH} ⁽¹³⁾	—	V _{dd}	V
Flash _{ENPB}	Flash Write Endurance ⁽¹⁴⁾	50,000	—	—	Cycles
Flash _{DR}	Flash Data Retention ⁽¹⁵⁾	10	20	—	Years

Notes

7. Vdd must be greater than or equal to 1.71V during startup, reset from the XRES pin, or reset from watchdog.
8. Always greater than 50 mV above V_{PPOR1} for falling supply.
9. Always greater than 50 mV above V_{PPOR2} for falling supply.
10. Always greater than 50 mV above V_{PPOR3} for falling supply.
11. Always greater than 50 mV above V_{PPOR0} voltage for falling supply.
12. Driving internal pull down resistor.
13. See appropriate [DC General Purpose IO Specifications](#) table. For Vdd > 3V use V_{OH4} in [Table 9 on page 16](#)
14. Erase/write cycles per block.
15. Following maximum Flash write cycles at Tamb = 55C and Tj = 70C.

AC Electrical Characteristics

AC Chip Level Specifications

Table 14 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 14. AC Chip Level Specifications

Symbol	Description	Min	Typ	Max	Units
F _{MAX}	Maximum Operating Frequency ⁽¹⁶⁾	24	–	–	MHz
F _{CPU}	Maximum Processing Frequency ⁽¹⁷⁾	24	–	–	MHz
F _{32K1}	Internal Low Speed Oscillator Frequency	19	32	50	kHz
F _{IMO24}	Internal Main Oscillator Stability for 24 MHz \pm 5% ⁽¹⁸⁾	22.8	24	25.2	MHz
F _{IMO12}	Internal Main Oscillator Stability for 12 MHz ⁽¹⁸⁾	11.4	12	12.6	MHz
F _{IMO6}	Internal Main Oscillator Stability for 6 MHz ⁽¹⁸⁾	5.7	6.0	6.3	MHz
DC _{IMO}	Duty Cycle of IMO	40	50	60	%
T _{RAMP}	Supply Ramp Time	0	–	–	μ s

AC General Purpose IO Specifications

Table 15 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 15. AC GPIO Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
F _{GPIO}	GPIO Operating Frequency	Normal Strong Mode, Port 0, 1	0	–	6 MHz for 1.71V<Vdd<2.4V	MHz
			0	–	12 MHz for 2.4V<Vdd<3.6V	
		Normal Strong Mode, Port 2, 3	0	–	3 MHz for 1.71V<Vdd<2.4V 6 MHz for 3.0V<Vdd<3.6V	MHz
TRise23	Rise Time, Strong Mode, Cload = 50 pF Ports 2 or 3	Vdd = 3.0 to 3.6V, 10% – 90%	15	–	80	ns
		Vdd = 2.4 to 3.0V, 10% – 90%	15	–	100	
TRise23L	Rise Time, Strong Mode Low Supply, Cload = 50 pF Ports 2 or 3	Vdd = 1.71 to 3.0V, 10% – 90%	15	–	100	ns
TRise01	Rise Time, Strong Mode, Cload = 50 pF Ports 0 or 1	Vdd = 3.0 to 3.6V, 10% – 90% LDO enabled or disabled	10	–	50	ns
		Vdd = 2.4 to 3.0V, 10% – 90% LDO enabled or disabled	10	–	70	
TRise01L	Rise Time, Strong Mode Low Supply, Cload = 50 pF Ports 0 or 1	Vdd = 1.71 to 3.0V, 10% – 90% LDO enabled or disabled	15	–	100	ns
TFall	Fall Time, Strong Mode, Cload = 50 pF All Ports	Vdd = 3.0 to 3.6V, 10% – 90%	10	–	80	ns
		Vdd = 1.71 to 3.0V, 10% - 90%	10	–	80	

Notes

16. Digital clocking functions.

17. CPU speed.

18. Trimmed using factory trim values.

Figure 5. GPIO Timing Diagram

AC External Clock Specifications

Table 16 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 16. AC External Clock Specifications

Symbol	Description	Min	Typ	Max	Units
F_{OSCEXT}	Frequency	0.750	–	25.2	MHz
–	High Period	20.6	–	5300	ns
–	Low Period	20.6	–	–	ns
–	Power Up IMO to Switch	150	–	–	μ s

AC Programming Specifications

Table 17 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 17. AC Programming Specifications

Symbol	Description	Min	Typ	Max	Units
T_{RSCLK}	Rise Time of SCLK	1	–	20	ns
T_{FSCLK}	Fall Time of SCLK	1	–	20	ns
T_{SSCLK}	Data Set up Time to Falling Edge of SCLK	40	–	–	ns
T_{HSCLK}	Data Hold Time from Falling Edge of SCLK	40	–	–	ns
F_{SCLK}	Frequency of SCLK	0	–	8	MHz
T_{ERASEB}	Flash Erase Time (Block)	–	–	18	ms
T_{WRITE}	Flash Block Write Time	–	–	25	ms
T_{DSCLK1}	Data Out Delay from Falling Edge of SCLK, 3.0V < Vdd < 3.6V	–	–	85	ns
T_{DSCLK2}	Data Out Delay from Falling Edge of SCLK, 1.71V < Vdd < 3.0V	–	–	130	ns

Figure 6. Timing Diagram - AC Programming Cycle

AC SPI Specifications

Table 18 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 18. AC SPI Specifications

Symbol	Description	Min	Typ	Max	Units
F _{SPI} M	Maximum Input Clock Frequency Selection, Master ⁽¹⁹⁾ 2.4V < V _{dd} < 3.6V	–	–	12	MHz
	Maximum Input Clock Frequency Selection, Master ⁽¹⁹⁾ 1.71V < V _{dd} < 2.4V	–	–	6	
F _{SPI} S	Maximum Input Clock Frequency Selection, Slave 2.4V < V _{dd} < 3.6V	–	–	12	MHz
	Maximum Input Clock Frequency Selection, Slave 1.71V < V _{dd} < 2.4V	–	–	6	
T _{SS}	Width of SS_ Negated Between Transmissions	50	–	–	ns

Notes

19. Output clock frequency is half of input clock rate.

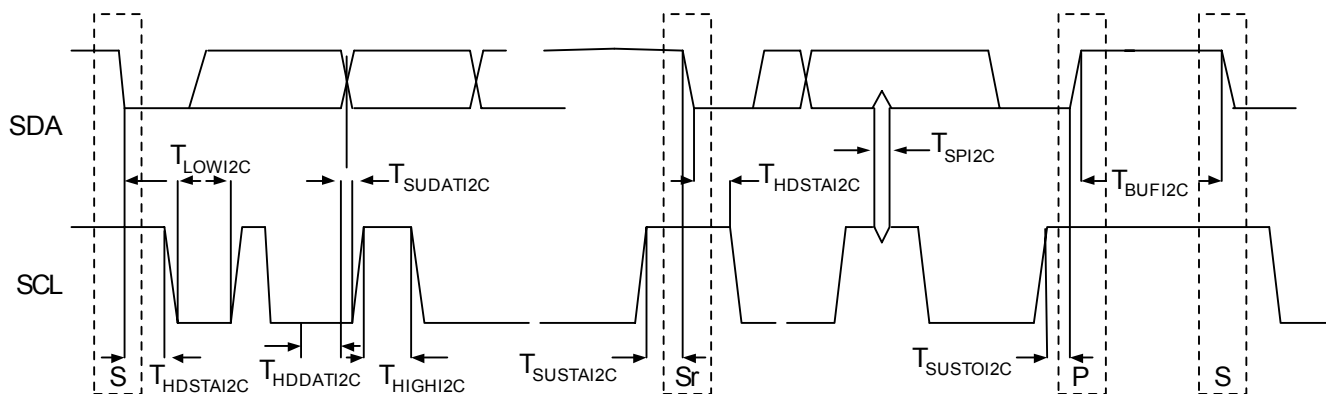

AC I²C Specifications

Table 19 lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 19. AC Characteristics of the I²C SDA and SCL Pins

Symbol	Description	Standard Mode		Fast Mode		Units
		Min	Max	Min	Max	
F _{SCL I2C}	SCL Clock Frequency	0	100	0	400	kHz
T _{HDSTAI2C}	Hold Time (repeated) START Condition. After this period, the first clock pulse is generated.	4.0	–	0.6	–	μs
T _{LOWI2C}	LOW Period of the SCL Clock	4.7	–	1.3	–	μs
T _{HIGHI2C}	HIGH Period of the SCL Clock	4.0	–	0.6	–	μs
T _{SUSTAI2C}	Setup Time for a Repeated START Condition	4.7	–	0.6	–	μs
T _{HDDATI2C}	Data Hold Time	0	–	0	–	μs
T _{SUDATI2C}	Data Setup Time	250	–	100 ⁽²⁰⁾	–	ns
T _{SUSTOI2C}	Set-up Time for STOP Condition	4.0	–	0.6	–	μs
T _{BUFI2C}	Bus Free Time Between a STOP and START Condition	4.7	–	1.3	–	μs
T _{SPI2C}	Pulse Width of Spikes are Suppressed by the Input Filter	–	–	0	50	ns

Figure 7. Definition of Timing for Fast/Standard Mode on the I²C Bus

Notes

20. A fast mode I2C bus device can be used in a standard mode I2C bus system, but the requirement $t_{SU,DAT} \leq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{SU,DAT} = 1000 + 250 = 1250$ ns (according to the standard mode I2C bus specification) before the SCL line is released.

Package Diagram

This chapter illustrates the packaging specifications for the enCoRe V LV device, along with the thermal impedances for each package.

Important Note Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the enCoRe V LV emulation tools and their dimensions, refer to the development kit.

Packaging Dimensions

Figure 8. 32-Pin (5 x 5 x 0.55 mm) QFN

001-42168 *B

Figure 9. 48-Pin (7 x 7 x 0.9 mm) QFN

001-13191 *C

Thermal Impedances

Table 20. Thermal Impedances per Package

Package	Typical θ_{JA} ⁽²¹⁾
32 QFN ⁽²²⁾	19.51 °C/W
48 QFN ⁽²²⁾	17.68 °C/W

Solder Reflow Peak Temperature

Following is the minimum solder reflow peak temperature to achieve good solderability.

Table 21. Solder Reflow Peak Temperature

Package	Minimum Peak Temperature ⁽²³⁾	Maximum Peak Temperature
32 QFN	240°C	260°C
48 QFN	240°C	260°C

Ordering Information

Ordering Code	Package Information	Flash	SRAM	No. of GPIOs	Target Applications
CY7C60445-32LQXC	32-Pin QFN (5x5x0.55 mm)	16K	1K	28	Feature-Rich Wireless Mouse
CY7C60445-32LQXCT	32-Pin QFN - (Tape and Reel) (5x5x0.55 mm)	16K	1K	28	Feature-Rich Wireless Mouse
CY7C60455-48LTXC	48-Pin QFN (7x7x0.9 mm)	16K	1K	36	Mid-Tier Wireless Keyboard
CY7C60455-48LTXCT	48-Pin QFN - (Tape and Reel) (7x7x0.9 mm)	16K	1K	36	Mid-Tier Wireless Keyboard
CY7C60456-48LTXC	48-Pin QFN (7x7x0.9 mm)	32K	2K	36	Feature-Rich Wireless Keyboard
CY7C60456-48LTXCT	48-Pin QFN - (Tape and Reel) (7x7x0.9 mm)	32K	2K	36	Feature-Rich Wireless Keyboard

Notes

21. $T_J = T_A + \text{Power} \times \theta_{JA}$

22. To achieve the thermal impedance specified for the package, solder the center thermal pad to the PCB ground plane.

23. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are $220 \pm 5^\circ\text{C}$ with Sn-Pb or $245 \pm 5^\circ\text{C}$ with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Document History Page

Document Title: CY7C60445, CY7C6045x, enCoRe™ V Low Voltage Microcontroller Document Number: 001-12395				
Rev.	ECN No.	Orig. of Change	Submission Date	Description of Change
**	626516	TYJ	See ECN	New data sheet
*A	735721	TYJ/ARI	See ECN	Added new block diagram, replaced TBDs, corrected values, updated pinout information, changed part number to reflect new specifications.
*B	1120504	ARI	See ECN	Corrected the description to pin 29 on Table 1, the Typ/Max values for I_{SB0} on the DC chip-level specifications, and the Min voltage value for $V_{DDIWRITE}$ in the DC Programming Specifications table. Corrected Flash Write Endurance minimum value in the DC Programming Specifications table. Corrected the Flash Erase Time max value and the Flash Block Write Time max value in the AC Programming Specifications table. Implemented new latest template.
*C	1225864	AESA/ARI	See ECN	Corrected the description to pin 13, 29 on Table 1 and 22,44 on Table 2. Added sections Register Reference, Register Conventions and Register Mapping Tables. Corrected Max values on the DC Chip-Level Specifications table.
*D	1446763	AESA	See ECN	Changed T_{ERASEB} parameter, max value to 18ms in Table 13, AC Programming Specification.
*E	1639963	AESA	See ECN	Post to www.cypress.com
*F	2138889	TYJ/PYRS	See ECN	Updated Ordering Code table: - Ordering code changed for 32-QFN package: From -32LKXC to -32LTXC - Added a new package type – “LTXC” for 48-QFN - Included Tape and Reel ordering code for 32-QFN and 48-QFN packages Changed active current values at 24, 12 and 6MHz in table “DC Chip-Level Specifications” - $IDD24$: 2.15 to 3.1mA - $IDD12$: 1.45 to 2.0mA - $IDD6$: 1.1 to 1.5mA Added information on using P1[0] and P1[1] as the I2C interface during POR or reset events
*G	2583853	TYJ/PYRS/HMT	10/10/08	Converted from Preliminary to Final ADC resolution changed from 10-bit to 8-bit On Page1, SPI Master and Slave – speeds changed Rephrased battery monitoring clause in page 1 to include “with external components” Included ADC specifications table V_{OH5} , V_{OH7} , V_{OH9} specs changed Flash data retention – condition added to Note [15] Input leakage spec changed to 25 nA max Under AC Char, Frequency accuracy of ILO corrected GPIO rise time for ports 0,1 and ports 2,3 made common AC Programming specifications updated Included AC Programming cycle timing diagram AC SPI specification updated Spec change for 32-QFN package Input Leakage Current maximum value changed to 1 uA Maximum specification for V_{OH5A} parameter changed from 2.0 to 2.1V Minimum voltages for F_{SPIM} and F_{SPIS} specifications changed from 1.8V to 1.71V (Table 18) Updated V_{OHV} parameter in Table 13 Updated Thermal impedance values for the packages - Table 20. Update Development Tools, add Designing with PSoC Designer. Edit, fix links and table format. Update TMs. Update maximum data in Table 12. DC POR and LVD Specifications.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at cypress.com/sales.
