

Brief Description

The ZSPM4523 is a DC/DC synchronous switching super capacitor charger with fully integrated power switches, internal compensation, and full fault protection. It uses a temperature-independent photo-voltaic maximum power point tracking (MPPT) calculator to optimize power output from the source during Full-Charge Mode. Its 1MHz switching frequency allows using small filter components, which results in smaller board space and reduced bill-of-material costs.

In Full-Charge Mode, the duty cycle is controlled by the MPPT function. Once the termination voltage is reached, the regulator operates in Constant Voltage Mode. When the regulator is disabled (the EN pin is low), the device draws 10 μ A (typical) quiescent current from V_{OUT}.

The ZSPM4523 integrates a wide range of protection circuitry, including input supply under-voltage lockout, output over-voltage protection, current limiting, and thermal shutdown.

The ZSPM4523 includes supervisory reporting via the NFLT (Inverted Fault) open-drain output to interface other components in the system. Device programming is achieved by the I²C™* interface through the SCL and SDA pins.

Benefits

- Up to 1.5A continuous output current
- High efficiency – up to 92% at typical load

Features

- Temperature-independent MPPT regulation
- V_{OUT} reverse-current blocking
- Programmable temperature-compensated termination voltage: 2.48 to 2.74 V $\pm$ 1%
- User programmable maximum charge current: 50mA to 1500mA
- Input supply under-voltage lockout
- Full protection for V_{OUT} over-voltage
- I²C™ program interface with EEPROM registers
- Charge status indication

Physical Characteristics

- Wide input voltage range: 3.2V to 7.2V
- Junction operating temperature -40°C to 125°C
- Packaged in a 16-pin PQFN (4mm x 4mm)

* I²C™ is a trademark of NXP.

1 ZSPM4523 Characteristics

Important: Stresses beyond those listed under “Absolute Maximum Ratings” (section 1.1) might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Thermal Characteristics” (section 1.2) and “Recommended Operating Conditions” (section 1.3) is not implied. Exposure to absolute–maximum–rated conditions for extended periods might affect device reliability.

1.1. Absolute Maximum Ratings

Over operating free–air temperature range unless otherwise noted.

Table 1.1 Absolute Maximum Ratings

Parameter	Value ¹⁾	Unit
VIN, EN, NFLT, SCL, SDA, VOUT, VSENSE	-0.3 to 8	V
SW	-1 to 8.8	V
VDD	-0.3 to 3.6	V
Operating Junction Temperature Range, T _J	-40 to 125	°C
Storage Temperature Range, T _{STOR}	-65 to 150	°C
Electrostatic Discharge – Human Body Model ²⁾	+/-2k	V
Electrostatic Discharge – Machine Model ²⁾	+/-200	V
Lead Temperature (soldering, 10 seconds)	260	°C
¹⁾ All voltage values are with respect to network ground terminal. ²⁾ ESD testing is performed according to the respective JESD22 JEDEC standard.		

1.2. Thermal Characteristics

Table 1.2 Thermal Characteristics

Parameter	Symbol	Value	Unit
Thermal Resistance Junction to Air ¹⁾	θ_{JA}	50	°C/W
¹⁾ Assumes 4x4mm QFN-16 in 1 in ² area of 2 oz. copper and 25°C ambient temperature.			

1.3. Recommended Operating Conditions

Table 1.3 Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Photovoltaic Input Operating Voltage	V_{IN}	3.2	5.3	7.2	V
Sense Resistor	R_{SENSE}		50		m Ω
Output Filter Inductor Typical Value ¹⁾	L_{OUT}		4.7		μ H
Output Filter Capacitor Typical Value ²⁾	C_{OUT}		4.7		μ F
Output Filter Capacitor ESR	$C_{OUT-ESR}$			100	m Ω
Input Supply Bypass Capacitor Typical Value ³⁾	C_{IN}	3.3	10		μ F
VDD Supply Bypass Capacitor Value ²⁾	C_{VDD}	70	100	130	nF
Operating Free Air Temperature	T_A	-40		85	$^{\circ}$ C
Operating Junction Temperature	T_J	-40		125	$^{\circ}$ C
1) For best performance, use an inductor with a saturation current rating higher than the maximum V_{OUT} load requirement plus the inductor current ripple. 2) For best performance, use a low ESR ceramic capacitor. 3) For best performance, use a low ESR ceramic capacitor. If C_{IN} is not a low ESR ceramic capacitor, add a 0.1μF ceramic capacitor in parallel to C_{IN}.					

1.4. Electrical Characteristics

Electrical Characteristics, $T_J = -40^{\circ}\text{C}$ to 125°C , $V_{IN} = 5.3\text{V}$ (unless otherwise noted).

Table 1.4 Electrical Characteristics

Parameter	Symbol	Condition	Min	Typ	Max	Unit
VIN Supply Voltage						
Photovoltaic Voltage Input	V_{IN}		3.2	5.3	7.2	V

1) The I²C™ interface will operate in either standard or fast mode. 2) Parameter not tested in production.						

2 Functional Description

The ZSPM4523 is a fully-integrated super capacitor charger IC based on a highly-efficient switching topology. It includes a maximum power point tracking (MPPT) function to optimize its input voltage to extract the maximum possible power from a photovoltaic cell. It includes configurability for termination voltage and charge current. A 1MHz internal switching frequency facilitates low-cost LC filter combinations.

When enabled, the ZSPM4523 will provide the maximum power available from a photovoltaic cell (Full-Charge Mode) until the output voltage reaches its termination point. At that point, it will begin to regulate voltage (Constant Voltage Mode). It will do so until a fault is detected, it is disabled, or the output voltage drops below the termination point.

Figure 2.1 ZSPM4523 Block Diagram

2.1. Internal Protection Features

2.1.1. VIN Under-Voltage Lockout

The device is held in the off state until the EN pin voltage is HIGH ($\geq 2.2\text{V}$) and VIN rises to 3.15V (typical). There is a 200mV (typical) hysteresis on this input, which requires the input to fall below 2.95V (typical) before the device will disable.

2.1.2. Internal Current Limit

The current through the L_{OUT} inductor is sensed on a cycle-by-cycle basis, and if the current limit (I_{OCD} , see section 1.4) is reached, it will abbreviate the cycle. Current limit is always active when the regulator is enabled.

2.1.3. Thermal Shutdown

If the junction temperature of the ZSPM4523 exceeds 170°C (typical), the SW output will tri-state to protect the device from damage. The NFLT and all other protection circuitry will stay active to inform the system of the failure mode. Once the device cools to 160°C (typical), the device will attempt to start up again. If the device reaches 170°C, the shutdown/restart sequence will repeat.

2.1.4. VOUT Over-Voltage Protection

The ZSPM4523 has an output protection circuit designed to shut down the charging profile if the output voltage is greater than the termination voltage. The termination voltage can be selected by user programming, so the protection threshold is set to 2% above the termination voltage. Shutting down the charging profile puts the ZSPM4523 in a fault condition.

3 Serial Interface

The ZSPM4523 features an I²C™ slave interface that offers advanced control and diagnostic features. It supports standard and fast mode data rates and auto-sequencing, and it is compliant to I²C™ standard version 3.0.

I²C™ operation offers configuration control for termination voltages, charge currents, and charge timeouts. This configurability allows optimum charging conditions. I²C™ operation also offers fault and warning indicators. Whenever a fault is detected, the associated status bit in the STATUS register is set and the NFLT pin is pulled low. If a warning is detected, the associated status bit in the STATUS register is set, but the NFLT pin is not pulled low. (See Table 3.2.) Reading of the STATUS register resets the fault and warning status bits, and the NFLT pin is released after all fault status bits have been reset.

3.1. I²C™ Subaddress Definition

Figure 3.1 Subaddress in I²C™ Transmission

3.2. I²C™ Bus Operation

The ZSPM4523's I²C™ bus is a two-wire serial interface; the two lines are serial clock (SCL) and serial data (SDA) (see Figure 3.2). SDA must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor. The devices communicating on this bus can drive the SDA line low or release it to high impedance. To ensure proper operation, setup, and hold times must be met. The device that initiates the I²C™ transaction becomes the master of the bus.

Communication is initiated by the master sending a START condition, which is a high-to-low transition on SDA while the SCL line is high. After the START condition, the device address byte is sent, most significant bit (MSB) first, including the data direction bit (read = 1; write = 0). After receiving the valid address byte, the device responds with an acknowledge (ACK). An ACK is a low on SDA during the high of the ACK-related clock pulse. On the I²C™ bus, during each clock pulse only one data bit is transferred. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as START or STOP control commands. A low-to-high transition on SDA while the SCL input is high indicates a STOP condition and is sent by the master (see Figure 3.2).

Any number of data bytes can be transferred from the transmitter to receiver between the START and the STOP conditions. Each byte of eight bits is followed by one ACK bit from the receiver. The SDA line must be released by the transmitter before the receiver can send an ACK bit. The receiver that acknowledges must pull down the SDA line during the ACK clock pulse, so that the SDA line is stable low during the high pulse of the ACK-related clock period. When a slave receiver is addressed, it must generate an ACK after each byte is received. Similarly, the master must generate an ACK after each byte that it receives from the slave transmitter. An end of data is signaled by the master receiver to the slave transmitter by not generating an acknowledge after the last byte has been clocked out of the slave. This is done by the master receiver by holding the SDA line high. The transmitter must then release the data line to enable the master to generate a STOP condition.

See section 1.5 for the timing for the periods labeled in Figure 3.3.

4 Application Circuits

4.1. Typical Application Circuits

Figure 4.1 Application Circuit

4.2. Selection of External Components

Note that the internal compensation is optimized for a 4.7 μ F output capacitor (C_{OUT}) and a 4.7 μ H output inductor (L_{OUT}). Table 1.3 provides recommended ranges for most of the following components.

4.2.1. C_{OUT} Output Capacitor

To keep the output ripple low, a low ESR (less than 35m Ω) ceramic capacitor is recommended for the 4.7 μ F output filter capacitor. The ESR should not exceed 100m Ω .

4.2.2. L_{OUT} Output Inductor

For best performance, an inductor with a saturation current rating higher than the maximum V_{OUT} load requirement plus the inductor current ripple should be used for the 4.7 μ H output filter inductor.

4.2.3. C_{IN} Bypass Capacitor for Input from Photovoltaic Source

For best performance, a low ESR ceramic capacitor should be used for the 10 μ F input supply bypass capacitor. If it is not a low ESR ceramic capacitor, a 0.1 μ F ceramic capacitor should be added in parallel to C_{IN} .

4.2.4. C_{VDD} Bypass Capacitor for VDD Internal Reference Voltage Output

For best performance, a low ESR ceramic capacitor should be used for the 100nF bypass capacitor from the VDD pin to ground.

4.2.5. R_{SENSE} Output Sensing Resistor

The typical value for the output sensing resistor is 50m Ω .

4.2.6. Pull-up Resistors

For proper function of the I²C™ interface, the SDA pin must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor.

For proper function of the fault-warning signal on the NFLT pin, it must be connected to a positive supply (VDD) through an external pull-up resistor.

5 Pin Configuration and Package

5.1. ZSPM4523 Package Dimensions

Figure 5.1 PQFN-16 Package Dimensions

5.2. Pin Assignments

Figure 5.2 ZSPM4523 Pin Assignments for 16-Pin 4mm x4mm PQFN

5.3. Pin Description

Table 5.1 ZSPM4523 Pin Description

Pin #	Name	Function	Description
1	SW	Switching Voltage Node	Connected to 4.7 μ H (typical) inductor L _{OUT} . Also connect to additional SW pin 14.
2	VIN	Photovoltaic Input Voltage	Input voltage for the photovoltaic cell. Also connect to C _{IN} . Also connect to additional VIN pin 11.
3	VSENSE	Current Sense Positive Input	Positive input for the MPPT current loop. Connect to the R _{SENSE} resistor to VOUT and the L _{OUT} inductor to SW.
4	VOUT	Super Cap Voltage	Regulator feedback input. Connect to the R _{SENSE} resistor to VSENSE and the C _{OUT} capacitor to ground across the load.
5	GND	GND	Primary ground for the majority of the device except the low-side power FET.
6	EN	Enable Input	When EN is high (≥ 2.2 V), the device is enabled. Ground the pin to disable the device. Includes internal pull-up.
7	NFLT	Inverted Fault	Open-drain output.
8	VDD	Internal 3.3V Supply Output	Connect to a 100nF capacitor to GND.
9	NC	Unused	Ground this pin for applications.
10	NC	Unused	Ground this pin for applications.
11	VIN	Photovoltaic Input Voltage	Additional VIN pin for input voltage from the photovoltaic cell; connect to VIN pin 2.
12	SCL	Clock Input	I ² C™ clock input.

Pin #	Name	Function	Description
13	SDA	Data Input/Output	I ² C™ data (open-drain output).
14	SW	Switching Voltage Node	Additional SW pin; connect to SW pin 1.
15	PGND	Power GND	GND supply for internal low-side FET/integrated diode. Also connect to additional PGND pin 16.
16	PGND	Power GND	GND supply for internal low-side FET/integrated diode. Also connect to additional PGND pin 15.

5.4. Package Markings

XXXXX: Lot Number (last five digits)
O: Pin 1 mark
YY: Year
WW: Work Week

6 Layout Recommendations

To maximize the efficiency of this package for application on a single layer or multi-layer PCB, certain guidelines must be followed when laying out this part on the PCB.

6.1 Multi-Layer PCB Layout

The following are guidelines for mounting the exposed pad ZSPM4523 on a multi-Layer PCB with ground a plane. In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, and thickness of copper, etc.

Figure 6.1 Package and PCB Land Configuration for Multi-Layer PCB

Figure 6.2 JEDEC Standard FR4 Multi-Layer Board – Cross-Sectional View

Figure 6.3 is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations, and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating for the linear regulators might need to be de-rated for higher ambient temperatures. The de-rated value will depend on calculated worst case power dissipation and the thermal management implementation in the application.

Figure 6.3 Conducting Heat Away from the Die using an Exposed Pad Package

6.2. Single-Layer PCB Layout

Layout recommendations for a single-layer PCB: Utilize as much copper area for power management as possible. In a single-layer board application, the thermal pad is attached to a heat spreader (copper areas) by using a low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above, it is advisable to use as much copper trace as possible to dissipate the heat.

Figure 6.4 Application Using a Single-Layer PCB

Important: If the attachment method is NOT implemented correctly, the functionality of the product is NOT guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.

7 Ordering Information

Ordering Code	Description	Package
ZSPM4523AA1W	ZSPM4523 High-Efficiency Regulator for Super Capacitor Systems	16-pin PQFN / 7" Reel (1000 parts)
ZSPM4523AA1R	ZSPM4523 High-Efficiency Regulator for Super Capacitor Systems	16-pin PQFN / 13" Reel (3300 parts)
ZSPM4523KIT	ZSPM4523 Evaluation Kit
