

HIGH-SPEED 4K x 9DUAL-PORT STATIC RAM

IDT7014S

LEAD FINISH (SnPb) ARE IN EOL PROCESS - LAST TIME BUY EXPIRES JUNE 15, 2018

Features:

- ♦ **True Dual-Ported memory cells which allow simultaneous reads of the same memory location**
- ♦ **High-speed access**
 - Commercial: 12/15/20/25ns (max.)
 - Industrial: 20ns (max.)
- ♦ **Standard-power operation**
 - IDT7014S
 - Active: 750mW (typ.)
- ♦ **Fully asynchronous operation from either port**
- ♦ **TTL-compatible; single 5V ($\pm 10\%$) power supply**
- ♦ **Available in 52-pin PLCC and a 64-pin TQFP**
- ♦ **Industrial temperature range (-40°C to $+85^{\circ}\text{C}$) is available for selected speeds**
- ♦ **Green parts available, see ordering information**

Description:

The IDT7014 is a high-speed 4K x 9 Dual-Port Static RAM designed to be used in systems where on-chip hardware port arbitration is not needed. This part lends itself to high-speed applications which do not rely on BUSY signals to manage simultaneous access.

The IDT7014 provides two independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. See functional description.

The IDT7014 utilizes a 9-bit wide data path to allow for parity at the user's option. This feature is especially useful in data communication applications where it is necessary to use a parity bit for transmission/reception error checking.

Fabricated using a high-performance technology, these Dual-Ports typically operate on only 750mW of power at maximum access times as fast as 12ns.

The IDT7014 is packaged in a 52-pin PLCC and a 64-pin thin quad flatpack, (TQFP).

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{TERM} must not exceed V_{CC} + 10% for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of V_{TERM} ≥ V_{CC} + 10%.

NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. The specification for t_{DH} must be met by the device supplying write data to the RAM under all operating conditions. Although t_{DH} and t_{OW} values will vary over voltage and temperature, the actual t_{DH} will always be smaller than the actual t_{OW}.
4. Port-to-port delay through RAM cells from writing port to reading port, refer to "Timing Waveform of Write With Port-to-Port Read".

Timing Waveform of Write Cycle^(1,2,3,4,5)

2528 drw 10

NOTES:

1. $R/\overline{W}$ must be HIGH during all address transitions.
2. t_{WR} is measured from $R/\overline{W}$ going HIGH to the end of write cycle.
3. During this period, the I/O pins are in the output state, and input signals must not be applied.
4. Transition is measured 0mV from the Low or High-impedance voltage with the Output Test Load (Figure 2).
5. If $\overline{OE}$ is LOW during a $R/\overline{W}$ controlled write cycle, the write pulse width must be the larger of t_{wp} or $(t_{wz} + t_{dw})$ to allow the I/O drivers to turn off data to be placed on the bus for the required t_{dw} . If $\overline{OE}$ is HIGH during an $R/\overline{W}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{wp} .

Functional Description

The IDT7014 provides two ports with separate control, address, and I/O pins that permit independent access for reads or writes to any location in memory. It lacks the chip enable feature of CMOS Dual Ports, thus it operates in active mode as soon as power is applied. Each port has its own Output Enable control ($\overline{OE}$). In the read mode, the port's $\overline{OE}$ turns on the output drivers when set LOW. The user application should avoid simultaneous write operations to the same memory location. There is no on-chip arbitration circuitry to resolve write priority and partial data from both ports may be written. READ/WRITE conditions are illustrated in Table 1.

Truth Table I – Read/Write Control

Left or Right Port ⁽¹⁾			
$R/\overline{W}$	$\overline{OE}$	D0-8	Function
L	X	$DATA_{IN}$	Data written into memory
H	L	$DATA_{OUT}$	Data in memory output on port
X	H	Z	High-impedance outputs

1. $A_{0L} - A_{11L}$ is not equal to $A_{0R} - A_{11R}$.
'H' = HIGH, 'L' = LOW, 'X' = Don't Care, and 'Z' = HIGH Impedance.
