LC66562B, 66566B**12 and 16-kbyte on-chip ROM capacities
CMOS 4-bit single-chip microcontrollers**

Overview

The LC66562B and 66566B are CMOS 4-bit microcontrollers that integrate in a single chip all the functionality required for control applications, including ROM, RAM, I/O ports, serial interfaces, comparator inputs, three-value inputs, timers, and interrupt functions. The LC66562B and 66566B are provided in LC66566A series.

The LC66562B and 66566B differ from the earlier LC66566A series in the power supply voltage range and certain other electrical specifications.

Features and Functions

- A 12- or 16-kbyte on-chip ROM capacity, and an on-chip RAM capacity of 512 by 4 bits
- Support for the full 128 instruction LC66000 series instruction set
- Fifty four I/O ports
- Two 8-bit serial interfaces (that can be connected in a 16-bit cascade format)
- Instruction cycle: 0.92 to 10 μ s (3 to 5.5 V)
- Powerful timer and prescaler functions
 - 12-bit timer based time limit timer, event counter, pulse width measurement, and square wave output functions
 - 8-bit timer based time limit timer, event counter, PWM output, and square wave output functions
 - 12-bit prescaler based time base function
- Powerful 11-factor 8-vector interrupt system
 - External interrupts: 6 factors, 3 vectors
 - Internal interrupts: 5 factors, 5 vectors
- Flexible I/O functions
 - Comparator inputs, three-value inputs, 20 mA drive outputs, 15 V breakdown voltage, pull-up/open drain option switching
- Runaway detection function (watchdog timer) option
- 8-bit I/O functions
- Low power functions using halt and hold modes
- Packages: DIP64S, QFP64E
- Test and evaluation ICs: LC66599 (evaluation chip) + EVA850/800-TB665xx
LC66E516 (built-in EPROM microcontroller)
LC66P516 (built-in OTPROM microcontroller)

Differences between the LC66562B/LC66566B and the LC66516B Series

Parameter	LC66516B series (including the EVA850/800-TB665XX tools)	LC66562B, 66566B
System level differences	65536 cycles: About 64 ms at 4 MHz ($T_{cyc} = 1 \mu s$)	16384 cycles: About 16 ms at 4 MHz ($T_{cyc} = 1 \mu s$)
• Hardware waiting time for clearing hold mode		
• The timer 0 value on reset (including the value after clearing hold mode)	The value FF0 is loaded	The value FFC is loaded
Feature differences	LC66512B, 516B 4.0 to 6.0 V/0.92 to 10 μs LC66E516, P516 4.5 to 5.5 V/0.92 to 10 μs	3.0 to 5.5 V/0.92 to 10 μs
• Operating power supply voltage/operating speed		

- An RC oscillator cannot be used with the LC66562B and LC66566B
- In addition there are differences in output currents and comparator input voltages.

For details, refer to the LC66516B, LC66E516, and LC66P516 catalogs.

Special care should be exercised with respect to these differences when using the LC66E516, and LC66P516 evaluation products.

Pin Description

Pin	I/O	Function	Output driver type	Options	Value on reset
P00 P01 P02 P03	I/O	I/O ports P00 to P03 • Input and output in 1 or 4 bit units • P00 to P03 have halt mode control functions	Pch: Pu MOS type Nch: Low sink current type	• Pu MOS attached or Nch OD output • Output level on reset	High or low (option)
P10 P11 P12 P13	I/O	I/O ports P10 to P13 • Input and output in 1 or 4 bit units	Pch: Pu MOS type Nch: Low sink current type	• Pu MOS attached or Nch OD output • Output level on reset	High or low (option)
P20/SI0 P21/SO0 P22/SCK0 P23/INT0	I/O	I/O ports P20 to P23 • Input and output in 1 or 4 bit units • P20 is also used as the serial input SI0. P21 is also used as the serial output SO0. P22 is also used as the serial clock SCK0. • P23 is also used as the INT0 interrupt request, the timer 0 event count, and the pulse width measurement inputs	Pch: CMOS type Nch: Low sink current type Breakdown voltage of +15 V on Nch OD	• CMOS or Nch OD output	High
P30/INT1 P31/POUT0 P32/POUT1	I/O	I/O ports P30 to P32 • Input and output in 1 or 3 bit units • P30 is also used as the INT1 interrupt request • P31 is also used as the square wave output from timer 0 • P32 is also used as the square wave output and PWM output from timer 1	Pch: CMOS type Nch: Low sink current type Breakdown voltage of +15 V on Nch OD	• CMOS or Nch OD output	High
P33/HOLD	I	Hold mode control input • Hold mode is set by a HOLD instruction when HOLD is low • In hold mode the CPU is restarted by setting the HOLD input high • This pin can be used as input port P33 along with P30 to P32 • When the P33/HOLD pin is low, the CPU will not be reset by a low level on RES. Therefore, applications must not hold the P33/HOLD pin low when power is first applied.			
P40 P41 P42 P43	I/O	I/O ports P40 to P43 • Input and output in 1 or 4 bit units • Input and output in 8 bit units when used in conjunction with P50 to P53 • ROM data output in 8 bit units when used in conjunction with P50 to P53	Pch: Pu MOS type Nch: Low sink current type	• Pu MOS attached or Nch OD output	High
P50 P51 P52 P53	I/O	I/O ports P50 to P53 • Input and output in 1 or 4 bit units • Input and output in 8 bit units when used in conjunction with P40 to P43 • ROM data output in 8 bit units when used in conjunction with P40 to P43	Pch: Pu MOS type Nch: Low sink current type	• Pu MOS attached or Nch OD output	High
P60/SI1 P61/SO1 P62/SCK1 P63/PIN1	I/O	I/O ports P60 to P63 • Input and output in 1 or 4 bit units • P60 is also used as the serial input SI1 • P61 is also used as the serial output SO1 • P62 is also used as the serial clock SCK1 • P63 is also used as the event count input to timer 1	Pch: CMOS type Nch: Low sink current type Breakdown voltage of +15 V on Nch OD	• CMOS or Nch OD output	High

Notes: PU MOS attached: Output pins with a pull-up MOS transistor

CMOS output: Complementary output

OD output: Open drain output

Pin	I/O	Function	Output driver type	Options	Value on reset
P70 P71 P72 P73	O	Output only ports P70 to P73 • Output in 1 or 4 bit units • The latched output values are read in by input instructions	Pch: Pu MOS type Nch: Low sink current type Breakdown voltage of +15 V on Nch OD	• Pu MOS attached or Nch OD output	High
P80 P81 P82 P83	O	Output only ports P80 to P83 • Output in 1 or 4 bit units • The latched output values are read in by input instructions • Pch OD output option available	Pch: CMOS type Nch: Low sink current type	• CMOS or Pch OD output • Output level on reset	High or low (option)
P90/INT2 P91/INT3 P92/INT4 P93/INT5	I/O	I/O ports P90 to P93 • Input and output in 1 or 4 bit units • P90 is also used as the INT2 interrupt request • P91 is also used as the INT3 interrupt request • P92 is also used as the INT4 interrupt request • P93 is also used as the INT5 interrupt request	Pch: CMOS type Nch: Low sink current type	• CMOS or Nch OD output	High
PA0 PA1 PA2 PA3	O	Output only ports PA0 to PA3 • Output in 1 or 4 bit units • The latched output values are read in by input instructions	Pch: Pu MOS type Nch: Low sink current type Breakdown voltage of +15 V on Nch OD	• Pu MOS attached or Nch OD output	High
PB0 PB1 PB2 PB3	O	Output only ports PB0 to PB3 • Output in 1 or 4 bit units • The latched output values are read in by input instructions	Pch: Pu MOS type Nch: Low sink current type	• Pu MOS attached or Nch OD output	High
PC0 PC1 PC2/VREF0 PC3/VREF1	I/O	I/O ports PC0 to PC3 • Input and output in 1 or 4 bit units • PC2 is also used as the VREF0 comparator comparison voltage pin • PC3 is also used as the VREF1 comparator comparison voltage pin	Pch: CMOS type Nch: Low sink current type	• CMOS or Nch OD output	High
PD0/CMP0 PD1/CMP1 PD2/CMP2 PD3/CMP3	I	Input only ports PD0 to PD3 • Can be switched in software to function as comparator inputs. The PD0 comparison voltage is VREF0. The PD1 to PD3 comparison voltage is VREF1. Comparators are specified in units of PD0, PD1 (PD2, PD3).			Normal input
PE0/TRA PE1/TRB	I	Input only ports • Can be switched in software to function as three value input ports			Normal input
OSC1 OSC2	I O	System clock oscillator pins. When an external clock is used, leave OSC2 open and input the clock signal to OSC1.		• Selection of ceramic oscillator or external clock	
RES	I	System reset input pin • The CPU is initialized when P33/HOLD is high and RES is set to low			
TEST	I	CPU test pin. Always connect this pin to V _{SS} during normal operation.			
V _{DD} V _{SS}		Power supply pins			

Notes: PU MOS attached: Output pins with a pull-up MOS transistor
 CMOS output: Complementary output
 OD output: Open drain output

User Options

1. Ports 0, 1, and 8 output level on reset option

The output levels for the I/O ports 0, 1, and 8 in 4-bit sets can selected to be either of the following two option.

Option	Conditions
High level output after reset	The 4 bits of each of ports 0, 1, and 8 as a set
Low level output after reset	The 4 bits of each of ports 0, 1, and 8 as a set

2. Oscillator circuit options

Option	Circuit	Conditions
External clock		Schmidt input
Ceramic oscillator		

Note: There is no RC oscillator option

3. Watchdog timer option

The provision or exclusion of a runaway program detection function can be selected as an option.

4. Port output format option

- The following two options are available in bit units for each of the ports P0, P1, P2, P3 (except for P33/HOLD), P4, P5, P6, P7, P9, PA, PB, and PC.

Option	Circuit	Conditions
Open drain output		P7, PA, and PB are output only. P2, P3, P6, and P9 are schmidt inputs.
Pull-up resistor output		P7, PA, and PB are output only. P2, P3, P6, and P9 are schmidt inputs. The CMOS output (P2, P3, P6, P9, and PC) and the Pu MOS outputs (P0, P1, P4, P5, P7, PA, and PB) are differentiated by the Pch Tr's drive ability.

- The following two options can be available in bit units for P8.

Option	Circuit	Conditions
Open drain output		
Pull-down resistor output		

- The PD comparator inputs and the PE three value inputs are selected in software.

Notes: 1. Applies to open drain output specification pins. For output specifications other than open drain, the ratings in other pin items apply.

2. For oscillator input and output, up to the free running oscillation frequency is allowed.

3. Input current (For pin P8, applies to the CMOS output specifications.)

4. Output current (For pins other than P8, applies to the pull-up output and to the CMOS output specifications.)

5. We recommend reflow soldering as the soldering method for QFP packages.

Please contact your Sanyo sales or technical representative for the conditions required for the use of methods in which the package itself is directly immersed in a solder dip bath.

Application Development Tools

Program development for the LC66562B and LC66566B is performed on an IBM compatible PC running MS-DOS. A cross assembler is available for each product. In addition, to assist program development, a program debugging unit (EVA850/800), an evaluation chip board (EVA850/800-TB665XX), and evaluation chip (LC66599) and a built-in EPROM microcontroller (LC66E516) are available.

Structure of the Application Development Tools

1. Program Debugging Unit (EVA850/800)

This is an emulator that provides an EPROM writing function and a function for serial data communication with external equipment, such as the host computer. It supports machine language application development as well as program correction and debugging. It provides program breaking, stepping, and tracing as its main debugging functions. Note that the EVA850/800 monitor ROM uses the MPM665XX.

2. Evaluation chip board (EVA800/850-TB665XX)

The evaluation chip board takes the control signals and ports output by the evaluation chip to a 64-pin connector, and converts them to a pin layout identical to that of mass produced chips. The evaluation chip board has jumper cables for option and state settings that allow I/O formats and functions identical to the mass produced chip to be setup.

Note however that the hold mode clear timing, and certain electrical characteristics will differ.

Jumpers

Type	OSC		Reset method		User application board power supply technique	
Jumper name	Jumper 1 (J1)		Jumper 2 (J2: RES)		Jumper 3 (J3: V _{DD})	
Jumper setting and mode	EXT	External oscillator (external clock)	INT (a)	Reset on a RUN instruction from the host computer	ON (a)	Supply V _{DD} to the user application board over the evaluation chip board output
	RC	RC oscillator	EXT (b)	Reset using a reset circuit on the user application board	OFF (b)	Use separate power supplies for the user application board and the evaluation chip power supply
	CF	CF oscillator				

Switches (SW1)

Type	Port 0, 1, and 8 output level on reset						Watchdog timer setting	
Switch name	P0S		P1S		P8S		WDC	
Switch setting and mode	ON	Port 0 high	ON	Port 1 high	ON	Port 8 high	ON	Watchdog timer
	OFF	Port 0 low	OFF	Port 1 low	OFF	Port 8 low	OFF	No watchdog timer

Note: RC0 and RC1 must both be turned on.

Switches SW2 to SW14: Pull-up resistor option setting

- Set these switches to the on position for ports for which the pull-up resistor option is selected, and set them to the open position when the open drain option is specified.
(SW10 — port 8 is for the pull-down resistor selection.)
- These can be set for individual port pins.

3. Cross Assembler

Cross assembler file name	Corresponding machine type	Programming limitations
LC66S.EXE	LC66562B/566B (LC66E516/P516) (LC66559)	4 SB instruction limitations • LC66562B: SB0, SB1, and SB2 can be used • LC66566B: SB0, SB1, SB2, and SB3 can be used • LC66E516/P516: SB0, SB1, SB2, and SB3 can be used • LC66599: SB0, SB1, SB2, and SB3 can be used

4. Simulation Chip (Refer to the LC66E516 Semiconductor Development News for details.)

The LC66E516 is a built-in EPROM microcontroller. By using a special purpose conversion board (the W66E516DH for DIP, and the W66E516QH for QFP versions) commercial PROM writers can be used to write programs. This allows the operation when mounted in an actual application to be confirmed.

• Form

The LC66E516 has the same pin layout and functions as the LC66562B and LC66566B.

Note however that the hold mode clear timing, and certain electrical characteristics will differ.

The pin assignment is shown in the figures below.

• Options

The options for the microcontroller to be evaluated (the port 0, 1, and 8 output levels after reset, the watchdog timer, and the port output formats) can be specified by setting internal EPROM data values. This allows evaluation using the same peripheral circuits as the end-product mass production board.

LC665XX Series Instruction Set Overview (by function)

Abbreviations used:

AC: Accumulator
 E: E register
 CF: Carry flag
 ZF: Zero flag
 HL: Data pointer DPH, DPL
 XY: Data pointer DPX, DPY
 M: Data memory
 M(HL): Data memory specified by the DPH, DPL data pointer
 M(XY): Data memory specified by the DPX, DPY auxiliary data pointer
 M2(HL): Two words of data memory (starting at an even address) specified by the DPH, DPL data pointer
 SP: Stack pointer
 M2(SP): Two words of data memory specified by the stack pointer
 M4(SP): Four words of data memory specified by the stack pointer
 in: N bits of immediate data
 t2: Bit specification

t2	11	10	01	00
Bit	2 ³	2 ²	2 ¹	2 ⁰

PCh: Bits 8 to 11 of the PC
 PCm: Bits 4 to 7 of the PC
 PCl: Bits 0 to 3 of the PC
 Fn: User flag, n = 0 to 15
 TIMER0: Timer 0
 TIMER1: Timer 1
 SIO: Serial I/O register
 P: Port
 P(i4): A port specified by 4 bits of immediate data
 INT: Interrupt flag
 (), []: Indicates content
 ←: Transfer direction, result
 ∨: Exclusive or
 ∧: Logical or
 ∨: Logical and
 +: Addition
 −: Subtraction
 —: Take the one's complement
