

# ML-7209

## UHF Planar Triode

4.5 kw Pulse Power

2.2 kw RF Pulse Power

ELECTRON TUBE SPECIALIST

### DESCRIPTION

The ML-7209 is a high- $\mu$  triode of the planar-electrode type designed for use as a grid- or plate-pulsed oscillator, switch tube, or frequency multiplier at frequencies up to 3 Gc. Features include low interelectrode capacitances, high transconductance and great mechanical strength. Lead inductances and rf losses are minimized by a compact, rugged coaxial con-

struction, making the tube ideally suited to cavity type circuits as well as for parallel line operation. The cathode is an indirectly-heated, oxide-coated disc. The anode is forced-air cooled. The ML-7209 is a direct replacement for the ML-381 but is constructed to withstand more severe conditions of shock and vibration.

Note 1 — For reduced filament voltage see "Heater Voltage" section under "Application Notes".

Note 2 — Measure at a plate voltage of 600 volts and a cathode-bias resistor of 30 ohms.

Note 3 — Measured at 1 mA of plate current and a plate voltage of 600 volts.

Note 4 — Capacitance measurements are with the tube cold. When the filament is heated to proper operating temperature the grid-cathode capacitance will increase by about 1 pf due to thermal expansion of the cathode.

Note 5 — With a plate-grid coaxial cavity of fixed dimensions, all tubes will resonate within the specified frequency range.

**APPLICATION NOTES**

Before designing equipment for use with these tubes and before installing tubes in equipment, refer to the general information given in the Machlett publication entitled *Application Notes, UHF Tubes — General*.
