## **About this Document**

This Data Sheet is addressed to embedded hardware and software developers. It provides the reader with detailed descriptions about the ordering designations, available features, electrical and physical characteristics of the XMC1100 series devices.

The document describes the characteristics of a superset of the XMC1100 series devices. For simplicity, the various device types are referred to by the collective term XMC1100 throughout this document.

### **XMC™1000 Family User Documentation**

The set of user documentation includes:

- **Reference Manual**
  - describes the functionality of the superset of devices.
- **Data Sheets**
  - list the complete ordering designations, available features and electrical characteristics of derivative devices.
- **Errata Sheets**
  - list deviations from the specifications given in the related Reference Manual or Data Sheets. Errata Sheets are provided for the superset of devices.

***Attention: Please consult all parts of the documentation set to attain consolidated knowledge about your device.***

Application related guidance is provided by **Users Guides** and **Application Notes**.

Please refer to <http://www.infineon.com/xmc1000> to get access to the latest versions of those documents.

## 1 Summary of Features

The XMC1100 devices are members of the XMC™1000 Family of microcontrollers based on the ARM Cortex-M0 processor core. The XMC1100 series devices are designed for general purpose applications.

**Figure 1 System Block Diagram**

### CPU Subsystem

- CPU Core
  - High-performance 32-bit ARM Cortex-M0 CPU
  - Most 16-bit Thumb and subset of 32-bit Thumb2 instruction set
  - Single cycle 32-bit hardware multiplier

**Summary of Features**

- System timer (SysTick) for Operating System support
- Ultra low power consumption
- Nested Vectored Interrupt Controller (NVIC)
- Event Request Unit (ERU) for processing of external and internal service requests

**On-Chip Memories**

- 8 kbytes on-chip ROM
- 16 kbytes on-chip high-speed SRAM
- up to 64 kbytes on-chip Flash program and data memory

**On-Chip Peripherals**

- Two Universal Serial Interface Channels (USIC), usable as UART, double-SPI, quad-SPI, IIC, IIS and LIN interfaces
- A/D Converters
  - up to 12 analog input pins and channels
  - 12-bit analog to digital converter
- Capture/Compare Units 4 (CCU4) for use as general purpose timers
- Window Watchdog Timer (WDT) for safety sensitive applications
- Real Time Clock module with alarm support (RTC)
- System Control Unit (SCU) for system configuration and control
- Pseudo random number generator (PRNG) for fast random data generation
- Temperature Sensor (TSE)

**Input/Output Lines With Individual Bit Controllability**

- Tri-stated in input mode
- Push/pull or open drain output mode
- Configurable pad hysteresis

**Debug System**

- Access through the standard ARM serial wire debug (SWD) or the single pin debug (SPD) interface
- A breakpoint unit (BPU) supporting up to 4 hardware breakpoints
- A watchpoint unit (DWT) supporting up to 2 watchpoints

**1.1 Ordering Information**

The ordering code for an Infineon microcontroller provides an exact reference to a specific product. The code “XMC1<DDD>-<Z><PPP><T><FFFF>” identifies:

- <DDD> the derivatives function set
- <Z> the package variant
  - T: TSSOP

- Q: VQFN
- <PPP> package pin count
- <T> the temperature range:
  - F: -40°C to 85°C
  - X: -40°C to 105°C
- <FFFF> the Flash memory size.

For ordering codes for the XMC1100 please contact your sales representative or local distributor.

This document describes several derivatives of the XMC1100 series, some descriptions may not apply to a specific product. Please see [Table 1](#).

For simplicity the term **XMC1100** is used for all derivatives throughout this document.

## 1.2 Device Types

These device types are available and can be ordered through Infineon's direct and/or distribution channels.

### 1.4 Chip Identification Number

The Chip Identification Number allows software to identify the marking. It is a 8 words value with the most significant 7 words stored in Flash configuration sector 0 (CS0) at address location : 1000 0F00<sub>H</sub> (MSB) - 1000 0F1B<sub>H</sub> (LSB). The least significant word and most significant word of the Chip Identification Number are the value of registers DBGROMID and IDCHIP, respectively.

## 2.2.1 Package Pin Summary

The following general building block is used to describe each pin:

**Table 5 Package Pin Mapping Description**

Function	Package A	Package B	...	Pad Type
Px.y	N	N		Pad Class

The table is sorted by the “Function” column, starting with the regular Port pins (Px.y), followed by the supply pins.

The following columns, titled with the supported package variants, lists the package pin number to which the respective function is mapped in that package.

The “Pad Type” indicates the employed pad type:

- STD\_INOUT (standard bi-directional pads)
- STD\_INOUT/AN (standard bi-directional pads with analog input)
- High Current (high current bi-directional pads)
- STD\_IN/AN (standard input pads with analog input)
- Power (power supply)

Details about the pad properties are defined in the Electrical Parameters.

### 2.2.2 Port I/O Function Description

The following general building block is used to describe the I/O functions of each PORT pin:

**Table 7 Port I/O Function Description**

Function	Outputs		Inputs	
	ALT1	ALTn	Input	Input
P0.0		MODA.OUT	MODC.INA	
Pn.y	MODA.OUT		MODA.INA	MODC.INB

**Figure 8 Simplified Port Structure**

Pn.y is the port pin name, defining the control and data bits/registers associated with it. As GPIO, the port is under software control. Its input value is read via Pn\_IN.y, Pn\_OUT defines the output value.

Up to seven alternate output functions (ALT1/2/3/4/5/6/7) can be mapped to a single port pin, selected by Pn\_IOCR.PC. The output value is directly driven by the respective module, with the pin characteristics controlled by the port registers (within the limits of the connected pad).

The port pin input can be connected to multiple peripherals. Most peripherals have an input multiplexer to select between different possible input sources.

The input path is also active while the pin is configured as output. This allows to feedback an output to on-chip resources without wasting an additional external pin.

Please refer to the [Port I/O Functions](#) table for the complete Port I/O function mapping.

### 2.2.3 Hardware Controlled I/O Function Description

The following general building block is used to describe the hardware I/O and pull control functions of each PORT pin:

**Table 8 Hardware Controlled I/O Function Description**

Function	Outputs	Inputs	Pull Control	
	HWO0	HWI0	HW0_PD	HW0_PU
P0.0	MODB.OUT	MODB.INA		
Pn.y			MODC.OUT	MODC.OUT

By Pn\_HWSEL, it is possible to select between different hardware “masters” (HWO0/HWI0, HWO1/HWI1). The selected peripheral can take control of the pin(s). Hardware control overrules settings in the respective port pin registers. Additional hardware signals HW0\_PD/HW1\_PD and HW0\_PU/HW1\_PU controlled by the peripherals can be used to control the pull devices of the pin.

Please refer to the [Hardware Controlled I/O Functions](#) table for the complete hardware I/O and pull control function mapping.

### 3 Electrical Parameter

This section provides the electrical parameter which are implementation-specific for the XMC1100.

#### 3.1 General Parameters

##### 3.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the XMC1100 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the "Symbol" column:

- **CC**  
Such parameters indicate **C**ontroller **C**haracteristics, which are distinctive feature of the XMC1100 and must be regarded for a system design.
- **SR**  
Such parameters indicate **S**ystem **R**equirements, which must be provided by the application system in which the XMC1100 is designed in.

### 3.1.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Table 11 Absolute Maximum Rating Parameters**

Parameter	Symbol		Values			Unit	Note / Test Condition
			Min	Typ.	Max.		
Junction temperature	$T_J$	SR	-40	–	115	°C	–
Storage temperature	$T_{ST}$	SR	-40	–	125	°C	–
Voltage on power supply pin with respect to $V_{SSP}$	$V_{DDP}$	S R	-0.3	–	6	V	–
Voltage on any pin with respect to $V_{SSP}$	$V_{IN}$	SR	-0.5	–	$V_{DDP} + 0.5$ or max. 6	V	whichever is lower
Voltage on any analog input pin with respect to $V_{SSP}$	$V_{AIN}$ $V_{AREF}$	SR	-0.5	–	$V_{DDP} + 0.5$ or max. 6	V	–
Input current on any pin during overload condition	$I_{IN}$	SR	-10	–	10	mA	–
Absolute maximum sum of all input currents during overload condition	$\Sigma I_{IN}$	SR	-50	–	+50	mA	–
Analog comparator input voltage	$V_{CM}$	SR	-0.3	–	$V_{DDP} + 0.3$	V	–

### 3.1.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

**Table 12** defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- **Operating Conditions** are met for
  - pad supply levels ( $V_{DDP}$ )
  - temperature

Electrical Parameter

If a pin current is outside of the **Operating Conditions** but within the overload conditions, then the parameters of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

*Note: An overload condition on one or more pins does not require a reset.*

*Note: A series resistor at the pin to limit the current to the maximum permitted overload current is sufficient to handle failure situations like short to battery.*

**Table 12 Overload Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input current on any port pin during overload condition	$I_{OV}$ SR	-5	–	5	mA	
Absolute sum of all input circuit currents during overload condition	$I_{OVS}$ SR	–	–	25	mA	

**Figure 9** shows the path of the input currents during overload via the ESD protection structures. The diodes against  $V_{DDP}$  and ground are a simplified representation of these ESD protection structures.

**Figure 9 Input Overload Current via ESD structures**

**Table 13** and **Table 14** list input voltages that can be reached under overload conditions. Note that the absolute maximum input voltages as defined in the **Absolute Maximum Ratings** must not be exceeded during overload.

**Table 13 PN-Junction Characteristics for positive Overload**

Pad Type	$I_{OV} = 5 \text{ mA}, T_J = -40 \text{ }^\circ\text{C}$	$I_{OV} = 5 \text{ mA}, T_J = 115 \text{ }^\circ\text{C}$
Standard, High-current, AN/DIG_IN	$V_{IN} = V_{DDP} + 0.5 \text{ V}$	$V_{IN} = V_{DDP} + 0.5 \text{ V}$

**Table 14 PN-Junction Characteristics for negative Overload**

Pad Type	$I_{OV} = 5 \text{ mA}, T_J = -40 \text{ }^\circ\text{C}$	$I_{OV} = 5 \text{ mA}, T_J = 115 \text{ }^\circ\text{C}$
Standard, High-current, AN/DIG_IN	$V_{IN} = V_{SS} - 0.5 \text{ V}$	$V_{IN} = V_{SS} - 0.5 \text{ V}$

### 3.1.4 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the XMC1100. All parameters specified in the following tables refer to these operating conditions, unless noted otherwise.

**Table 15 Operating Conditions Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Ambient Temperature	$T_A$ SR	-40	–	85	°C	Temp. Range F
		-40	–	105	°C	Temp. Range X
Digital supply voltage <sup>1)</sup>	$V_{DDP}$ SR	1.8	–	5.5	V	
MCLK Frequency	$f_{MCLK}$ CC	–	–	33.2	MHz	CPU clock
PCLK Frequency	$f_{PCLK}$ CC	–	–	66.4	MHz	Peripherals clock
Short circuit current of digital outputs	$I_{SC}$ SR	-5	–	5	mA	
Absolute sum of short circuit currents of the device	$\Sigma I_{SC\_D}$ SR	–	–	25	mA

### 3.2 DC Parameters

#### 3.2.1 Input/Output Characteristics

**Table 16** provides the characteristics of the input/output pins of the XMC1100.

*Note: These parameters are not subject to production test, but verified by design and/or characterization.*

*Note: Unless otherwise stated, input DC and AC characteristics, including peripheral timings, assume that the input pads operate with the standard hysteresis.*

**Electrical Parameter**

- 8) Hysteresis is implemented to avoid meta stable states and switching due to internal ground bounce. It cannot be guaranteed that it suppresses switching due to external system noise.
- 9) An additional error current ( $I_{INJ}$ ) will flow if an overload current flows through an adjacent pin.
- 10) However, for applications with strict low power-down current requirements, it is mandatory that no active voltage source is supplied at any GPIO pin when  $V_{DDP}$  is powered off.

1) The parameters are defined for ADC clock frequency  $f_{SH} = 32$  MHz.

2) No pending samples assumed, excluding sampling time and calibration.

3) Includes synchronization and calibration (average of gain and offset calibration).

4) This parameter can also be defined as an SNR value:  $SNR[dB] = 20 \times \log(A_{MAXeff} / N_{RMS})$ .

With  $A_{MAXeff} = 2^N / 2$ ,  $SNR[dB] = 20 \times \log(2048 / N_{RMS})$  [N = 12].

$N_{RMS} = 1.5$  LSB<sub>12</sub>, therefore, equals  $SNR = 20 \times \log(2048 / 1.5) = 62.7$  dB.

5) Includes error from the reference voltage.

### 3.3.2 Power-Up and Supply Monitoring Characteristics

**Table 22** provides the characteristics of the supply monitoring in XMC1100.

The guard band between the lowest valid operating voltage and the brownout reset threshold provides a margin for noise immunity and hysteresis. The electrical parameters may be violated while  $V_{DDP}$  is outside its operating range.

The brownout detection triggers a reset within the defined range. The prewarning detection can be used to trigger an early warning and issue corrective and/or fail-safe actions in case of a critical supply voltage drop.

*Note: These parameters are not subject to production test, but verified by design and/or characterization.*

BMI program time	$t_{BMI}$ SR	–	8.25	–	ms	Time taken from a user-triggered system reset after BMI installation is requested

- 1) Not all parameters are 100% tested, but are verified by design/characterisation.
- 2) A capacitor of at least 100 nF has to be added between  $V_{DDP}$  and  $V_{SSP}$  to fulfill the requirement as stated for this parameter.
- 3) Valid for a 100 nF buffer capacitor connected to supply pin where current from capacitor is forwarded only to the chip. A larger capacitor value has to be chosen if the power source sink a current.
- 4) This values does not include the ramp-up time. During startup firmware execution, MCLK is running at 32 MHz and the clocks to peripheral as specified in register CGATSTAT0 are gated.

**Figure 18 SWD Timing**

### 3.3.5 SPD Timing Requirements

The optimum SPD decision time between  $0_B$  and  $1_B$  is  $0.75 \mu\text{s}$ . With this value the system has maximum robustness against frequency deviations of the sampling clock on tool and on device side. However it is not always possible to exactly match this value with the given constraints for the sample clock. For instance for a oversampling rate of 4, the sample clock will be 8 MHz and in this case the closest possible effective decision time is 5.5 clock cycles ( $0.69 \mu\text{s}$ ).

**Table 26 Optimum Number of Sample Clocks for SPD**

Sample Freq.	Sampling Factor	Sample Clocks $0_B$	Sample Clocks $1_B$	Effective Decision Time <sup>1)</sup>	Remark
8 MHz	4	1 to 5	6 to 12	$0.69 \mu\text{s}$	The other closest option ( $0.81 \mu\text{s}$ ) for the effective decision time is less robust.

1) Nominal sample frequency period multiplied with  $0.5 + (\text{max. number of } 0_B \text{ sample clocks})$

For a balanced distribution of the timing robustness of SPD between tool and device, the timing requirements for the tool are:

- Frequency deviation of the sample clock is +/- 5%
- Effective decision time is between  $0.69 \mu\text{s}$  and  $0.75 \mu\text{s}$  (calculated with nominal sample frequency)

### 3.3.6 Peripheral Timings

*Note: These parameters are not subject to production test, but verified by design and/or characterization.*

#### 3.3.6.1 Synchronous Serial Interface (USIC SSC) Timing

The following parameters are applicable for a USIC channel operated in SSC mode.

*Note: Operating Conditions apply.*

**Table 27 USIC SSC Master Mode Timing**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SCLKOUT master clock period	$t_{\text{CLK}}$ CC	62.5	–	–	ns	
Slave select output SELO active to first SCLKOUT transmit edge	$t_1$ CC	80	–	–	ns

Parameter	Symbol		Values			Unit	Note / Test Condition
			Min.	Typ.	Max.		
DX1 slave clock period	$t_{CLK}$	SR	125	–	–	ns	
Select input DX2 setup to first clock input DX1 transmit edge <sup>1)</sup>	$t_{10}$	SR	10	–	–	ns	
Select input DX2 hold after last clock input DX1 receive edge <sup>1)</sup>	$t_{11}$	SR	10	–	–	ns	
Receive data input DX0/DX[5:3] setup time to shift clock receive edge <sup>1)</sup>	$t_{12}$	SR	10	–	–	ns	
Data input DX0/DX[5:3] hold time from clock input DX1 receive edge <sup>1)</sup>	$t_{13}$	SR	10	–	–	ns	
Data output DOUT[3:0] valid time	$t_{14}$	CC	-	–	80	ns	

1) These input timings are valid for asynchronous input signal handling of slave select input, shift clock input, and receive data input (bits DXnCR.DSEN = 0).

**Figure 19 USIC - SSC Master/Slave Mode Timing**

*Note: This timing diagram shows a standard configuration, for which the slave select signal is low-active, and the serial clock signal is not shifted and not inverted.*

### 3.3.6.2 Inter-IC (IIC) Interface Timing

The following parameters are applicable for a USIC channel operated in IIC mode.

*Note: Operating Conditions apply.*

**Table 29 USIC IIC Standard Mode Timing<sup>1)</sup>**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.

## 4 Package and Reliability

The XMC1100 is a member of the XMC™1000 Family of microcontrollers. It is also compatible to a certain extent with members of similar families or subfamilies.

Each package is optimized for the device it houses. Therefore, there may be slight differences between packages of the same pin-count but for different device types. In particular, the size of the exposed die pad may vary.

If different device types are considered or planned for an application, it must be ensured that the board layout fits all packages under consideration.

### 4.1 Package Parameters

1) Device mounted on a 4-layer JEDEC board (JESD 51-5); exposed pad soldered.

*Note: For electrical reasons, it is required to connect the exposed pad to the board ground  $V_{SSP}$ , independent of EMC and thermal requirements.*

#### 4.1.1 Thermal Considerations

When operating the XMC1100 in a system, the total heat generated in the chip must be dissipated to the ambient environment to prevent overheating and the resulting thermal damage.

The maximum heat that can be dissipated depends on the package and its integration into the target board. The “Thermal resistance  $R_{\theta JA}$ ” quantifies these parameters. The power dissipation must be limited so that the average junction temperature does not exceed 115 °C.

The difference between junction temperature and ambient temperature is determined by

$$\Delta T = (P_{INT} + P_{IOSTAT} + P_{IODYN}) \times R_{\theta JA}$$

The internal power consumption is defined as

$$P_{\text{INT}} = V_{\text{DDP}} \times I_{\text{DDP}} \text{ (switching current and leakage current).}$$

The static external power consumption caused by the output drivers is defined as

$$P_{\text{IOSTAT}} = \Sigma((V_{\text{DDP}} - V_{\text{OH}}) \times I_{\text{OH}}) + \Sigma(V_{\text{OL}} \times I_{\text{OL}})$$

The dynamic external power consumption caused by the output drivers ( $P_{\text{IODYN}}$ ) depends on the capacitive load connected to the respective pins and their switching frequencies.

If the total power dissipation for a given system configuration exceeds the defined limit, countermeasures must be taken to ensure proper system operation:

- Reduce  $V_{\text{DDP}}$ , if possible in the system
- Reduce the system frequency
- Reduce the number of output pins
- Reduce the load on active output drivers

## 5 Quality Declaration

Table 34 shows the characteristics of the quality parameters in the XMC1100.

**Table 34 Quality Parameters**

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
ESD susceptibility according to Human Body Model (HBM)	$V_{\text{HBM}}$ SR	-	2000	V	Conforming to EIA/JESD22-A114-B
ESD susceptibility according to Charged Device Model (CDM) pins	$V_{\text{CDM}}$ SR	-	500	V	Conforming to JESD22-C101-C
Moisture sensitivity level	$MSL$ CC	-	3	-	JEDEC J-STD-020D
Soldering temperature	$T_{\text{SDR}}$ SR	-	260	°C	Profile according to JEDEC J-STD-020D
