Crossbar Switch

DESCRIPTION

The STP2230SOP crossbar switch [1] acts as the bridge among three UltraSPARC UPA devices. One of the buses is dedicated to interfacing to system memory, while the other two are general-purpose buses. These buses are used for interfacing memory, a processor bus, and an I/O bus. In this particular configuration, eighteen XB1s are required per system implementation.

FEATURES

- Three-port crossbar
  - 16-bit data
  - 8-bit processor
  - 4-bit data ports
- Decoupled memory port; loading and unloading of memory data can take place in parallel with other operations
- Burst transfers operate on four bytes of data per slice
- Power-up safe buses; all buses power up tristated so there will be no bus contention with other parts which may be on the buses
- Implemented in 0.8-micron BiCMOS and housed in a 48-pin TSSOP package (also called DGG or “shrink-wide bus”)

1. The STP2230SOP crossbar switch is also referred to as BMX.

1. Operation of the device at values in excess of those listed above will result in degradation or destruction of the device. All voltages are defined with respect to ground. Functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
