Please note that Cypress is an Infineon Technologies Company.
The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content
The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers
Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

How to Check the Ordering Part Number

1. Go to www.cypress.com/pcn.
2. Enter the keyword (for example, ordering part number) in the **SEARCH PCNS** field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes

For More Information

Please contact your local sales office for additional information about Cypress products and solutions.

About Cypress

Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. To learn more, go to www.cypress.com.

MB95690K Series

New 8FX 8-bit Microcontrollers

The MB95690K Series is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of this series contain a variety of peripheral functions.

Features

- F²MC-8FX CPU core
  - Instruction set optimized for controllers
    - Multiplication and division instructions
    - 16-bit arithmetic operations
    - Bit test branch instructions
    - Bit manipulation instructions, etc.
- Clock
  - Selectable main clock source
    - Main oscillation clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)
    - External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)
    - Main CR clock (4 MHz ±2%)
    - Main CR PLL clock
      - The main CR PLL clock frequency becomes 8 MHz ±2% when the PLL multiplication rate is 2.
      - The main CR PLL clock frequency becomes 10 MHz ±2% when the PLL multiplication rate is 2.5.
      - The main CR PLL clock frequency becomes 12 MHz ±2% when the PLL multiplication rate is 3.
      - The main CR PLL clock frequency becomes 16 MHz ±2% when the PLL multiplication rate is 4.
  - Selectable subclock source
    - Suboscillation clock (32.768 kHz)
    - External clock (32.768 kHz)
    - Sub-CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 150 kHz)
- Timer
  - 8/16-bit composite timer × 2 channels
  - 8/16-bit PPG × 3 channels
  - 16-bit PPG timer × 1 channel (can work independently or together with the multi-pulse generator)
  - 16-bit reload timer × 1 channel (can work independently or together with the multi-pulse generator)
  - Time-base timer × 1 channel
  - Watch prescaler × 1 channel
- UART/SIO × 1 channel
  - Full duplex double buffer
  - Capable of clock asynchronous (UART) serial data transfer and clock synchronous (SIO) serial data transfer
- I²C bus interface × 1 channel
  - Built-in wake-up function
- Multi-pulse generator (MPG) (for DC motor control) × 1 channel
  - 16-bit reload timer × 1 channel
  - 16-bit PPG timer × 1 channel
  - Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)
- LIN-UART
  - Full duplex double buffer
  - Capable of clock asynchronous serial data transfer and clock synchronous serial data transfer
- External interrupt
  - LQF044: 7 channels
  - LQA048, LQC052, WNR048: 8 channels
  - Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
  - Can be used to wake up the device from different low power consumption (standby) modes
- 8/10-bit A/D converter
  - LQF044: 8 channels
  - LQA048, LQC052, WNR048: 12 channels
  - 8-bit or 10-bit resolution can be selected.
- Low power consumption (standby) modes
  - There are four standby modes as follows:
    - Stop mode
    - Sleep mode
    - Watch mode
    - Time-base timer mode
  - In standby mode, two further options can be selected: normal standby mode and deep standby mode.
- I/O port
  - LQF044 (number of I/O ports: 41)
    - General-purpose I/O ports (CMOS I/O):37
    - General-purpose I/O ports (N-ch open drain):4
  - LQA048, LQC052, WNR048 (number of I/O ports: 45)
    - General-purpose I/O ports (CMOS I/O):41
    - General-purpose I/O ports (N-ch open drain):4
- On-chip debug
  - 1-wire serial control
  - Serial writing supported (asynchronous mode)
- Hardware/software watchdog timer
  - Built-in hardware watchdog timer
  - Built-in software watchdog timer
- Power-on reset
  - A power-on reset is generated when the power is switched on.
- Low-voltage detection (LVD) reset circuit
  - The LVD function is enabled by default. For details, see “20.2 Recommended Operating Conditions” in “Electrical Characteristics”.
  - The LVD function can be controlled through software.

- ❒ The LVD reset circuit control register (LVDCC) enables or disables the LVD reset.
- ❒ The LVD reset circuit has an internal low-voltage detector. The combination of detection voltage and release voltage can be selected from four options.

■ Comparator × 2 channels
- ❒ Built-in dedicated BGR
- ❒ The comparator reference voltage can be selected between the BGR voltage and the comparator pin.

■ Clock supervisor counter
- ❒ Built-in clock supervisor counter

■ Dual operation Flash memory
- ❒ The program/erase operation and the read operation can be executed in different banks (upper bank/lower bank) simultaneously.

■ Flash memory security function
- ❒ Protects the content of the Flash memory.

Contents

1. Product Line-up

Part number / Parameter	MB95F694K	MB95F696K	MB95F698K
Type	Flash memory product		
Clock supervisor counter	It supervises the main clock oscillation and the subclock oscillation.		
Flash memory capacity	20 Kbyte	36 Kbyte	60 Kbyte
RAM capacity	512 bytes	1 Kbyte	2 Kbyte
Power-on reset	Yes		
Low-voltage detection reset	Controlled through software		
Reset input	Selected through software		
CPU functions	• Number of basic instructions : 136 • Instruction bit length : 8 bits • Instruction length : 1 to 3 bytes • Data bit length : 1, 8 and 16 bits • Minimum instruction execution time : 61.5 ns (machine clock frequency = 16.25 MHz) • Interrupt processing time : 0.6 µs (machine clock frequency = 16.25 MHz)		
General-purpose I/O	• LQF044 - I/O port : 41 - CMOS I/O : 37 - N-ch open drain : 4 • LQA048, LQC052, WNR048 - I/O port : 45 - CMOS I/O : 41 - N-ch open drain : 4		
Time-base timer	Interval time: 0.256 ms to 8.3 s (external clock frequency = 4 MHz)		
Hardware/ software watchdog timer	• Reset generation cycle Main oscillation clock at 10 MHz: 105 ms (Min) • The sub-CR clock can be used as the source clock of the software watchdog timer.		
Wild register	It can be used to replace 3 bytes of data.		
LIN-UART	• A wide range of communication speed can be selected by a dedicated reload timer. • It has a full duplex double buffer. • Both clock synchronous serial data transfer and clock asynchronous serial data transfer are enabled. • The LIN function can be used as a LIN master or a LIN slave.		
8/10-bit A/D converter	• LQF044: 8 channels • LQA048, LQC052, WNR048: 12 channels		
	8-bit or 10-bit resolution can be selected.		

Part number / Parameter	MB95F694K	MB95F696K	MB95F698K
8/16-bit composite timer	2 channels		
	• The timer can be configured as an “8-bit timer × 2 channels” or a “16-bit timer × 1 channel”. • It has the following functions: interval timer function, PWC function, PWM function and input capture function. • Count clock: it can be selected from internal clocks (seven types) and external clocks. • It can output square wave.		
External interrupt	• LQF044: 7 channels • LQA048, LQC052, WNR048: 8 channels		
	• Interrupt by edge detection (The rising edge, falling edge, and both edges can be selected.) • It can be used to wake up the device from different standby modes.		
On-chip debug	• 1-wire serial control • It supports serial writing (asynchronous mode).		
UART/SIO	1 channel		
	• Data transfer with UART/SIO is enabled. • It has a full duplex double buffer, variable data length (5/6/7/8 bits), an internal baud rate generator and an error detection function. • It uses the NRZ type transfer format. • LSB-first data transfer and MSB-first data transfer are available to use. • Both clock asynchronous (UART) serial data transfer and clock synchronous (SIO) serial data transfer are enabled.		
I^2C bus interface	1 channel		
	• Master/slave transmission and reception • It has the following functions: bus error function, arbitration function, transmission direction detection function, wake-up function, and functions of generating and detecting repeated START conditions.		
8/16-bit PPG	3 channels		
	• Each channel can be used as an “8-bit timer × 2 channels” or a “16-bit timer × 1 channel”. • The counter operating clock can be selected from eight clock sources.		
16-bit PPG timer	1 channel		
	• PWM mode and one-shot mode are available to use. • The counter operating clock can be selected from eight clock sources. • It supports external trigger start. • It can work independently or together with the multi-pulse generator.		
16-bit reload timer	1 channel		
	• Two clock modes and two counter operating modes are available to use. • It can output square wave. • Count clock: it can be selected from internal clocks (seven types) and external clocks. • Two counter operating modes: reload mode and one-shot mode • It can work independently or together with the multi-pulse generator.		
Multi-pulse generator (for DC motor control)	• 16-bit PPG timer: 1 channel • 16-bit reload timer operations: toggle output, one-shot output • Event counter: 1 channel • Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)

3. Differences Among Products And Notes On Product Selection

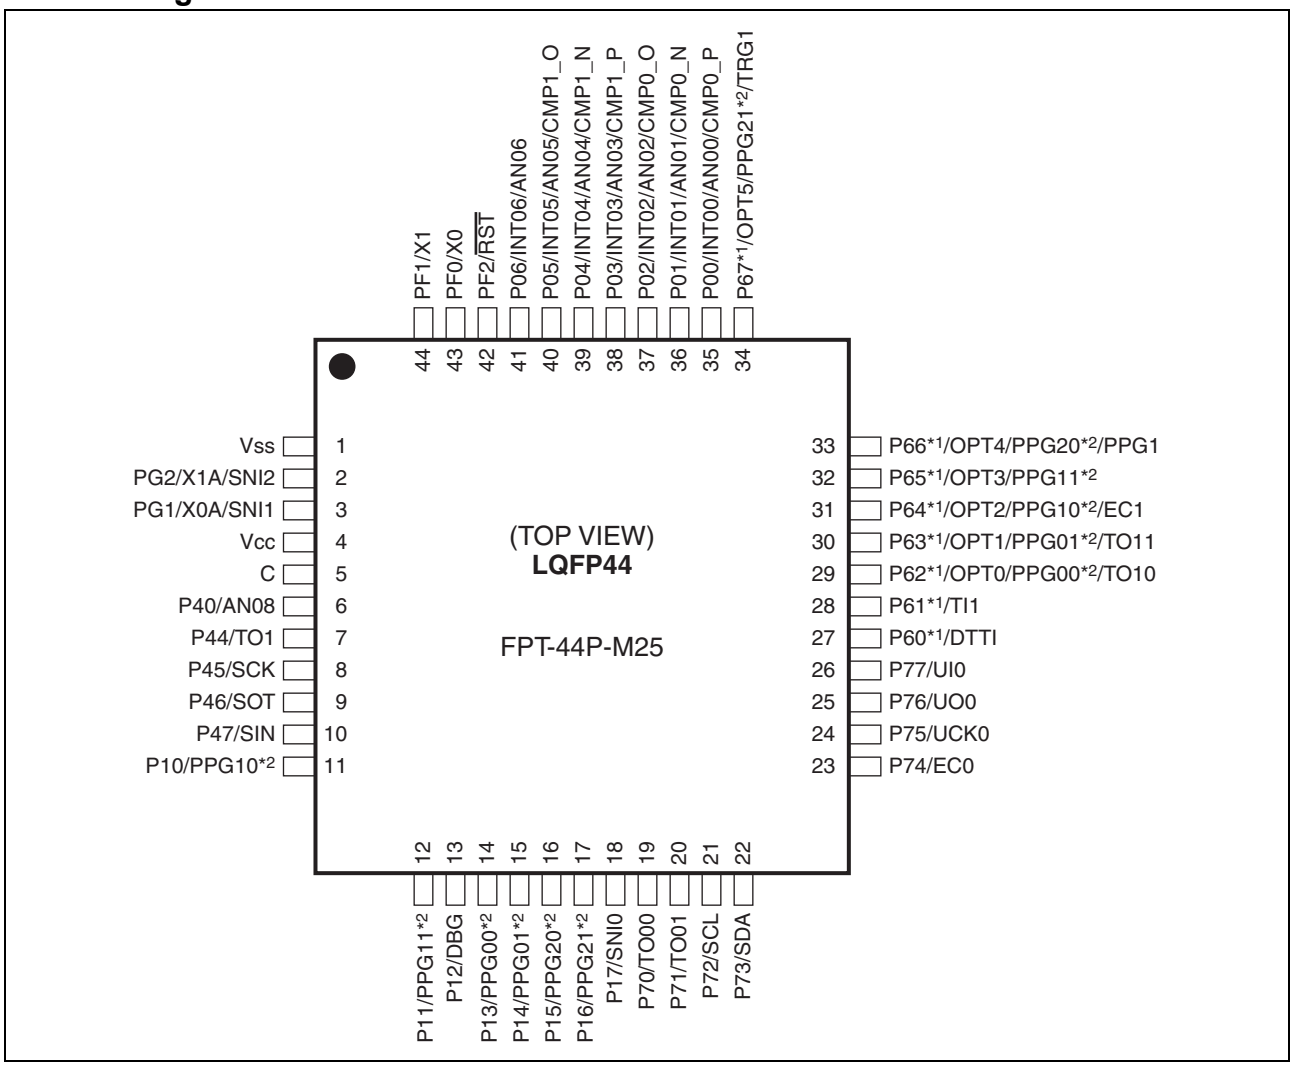
- Current consumption
  When using the on-chip debug function, take account of the current consumption of Flash memory program/erase.
  For details of current consumption, see “Electrical Characteristics”.

- Package
  For details of information on each package, see “Packages And Corresponding Products” and “Package Dimension”.

- Operating voltage
  The operating voltage varies, depending on whether the on-chip debug function is used or not.
  For details of operating voltage, see “Electrical Characteristics”.

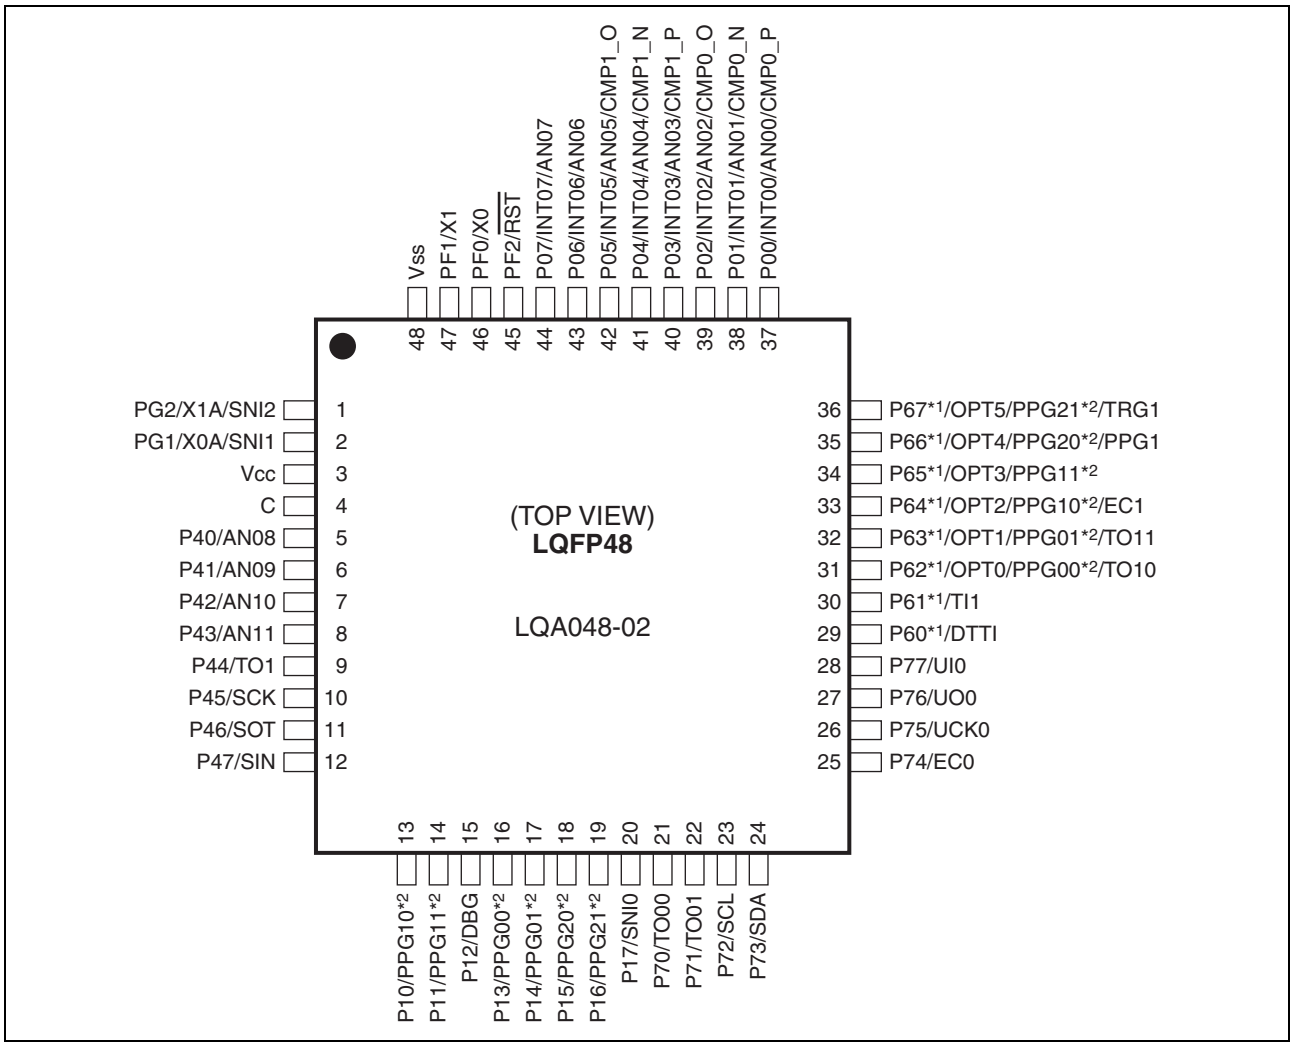
- On-chip debug function
  The on-chip debug function requires that V_{CC}, V_{SS} and one serial wire be connected to an evaluation tool. For details of the connection method, refer to “CHAPTER 25 EXAMPLE OF SERIAL PROGRAMMING CONNECTION” in “New 8FX MB95690K Series Hardware Manual”.

4. Pin Assignment



*1: High-current pin (8 mA/12 mA)

*2: The 8/16-bit PPG output pins are mapped to port 1 by default. To map the 8/16-bit PPG output pins to port 6, write "1" to the PPGSEL bit in the SYSC register.



*1: High-current pin (8 mA/12 mA)

*2: The 8/16-bit PPG output pins are mapped to port 1 by default. To map the 8/16-bit PPG output pins to port 6, write “1” to the PPGSEL bit in the SYSC register.

*6: Pull-up

7. I/O Circuit Type

Type	Circuit	Remarks
A		• N-ch open drain output • Hysteresis input • Reset output
B		• Oscillation circuit • High-speed side Feedback resistance: approx. 1 MΩ • CMOS output • Hysteresis input
C		• Oscillation circuit • Low-speed side Feedback resistance: approx. 5 MΩ • CMOS output • Hysteresis input • Pull-up control

Type	Circuit	Remarks
D		• CMOS output • Hysteresis input • Pull-up control • High current output
E		• CMOS output • Hysteresis input • Pull-up control • Analog input
F		• CMOS output • Hysteresis input • Pull-up control
G		• N-ch open drain output • Hysteresis input
H		• N-ch open drain output • CMOS input

Type	Circuit	Remarks
I		• CMOS output • CMOS input • Pull-up control

8. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

8.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

• Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

• Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

• Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

- **Latch-up**

  Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

  CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

  (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.

  (2) Be sure that abnormal current flows do not occur during the power-on sequence.

- **Observance of Safety Regulations and Standards**

  Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

- **Fail-Safe Design**

  Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

- **Precautions Related to Usage of Devices**

  Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

  CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

8.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

- **Lead Insertion Type**

  Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

  Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

  If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

- **Surface Mount Type**

  Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

  You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

- **Lead-Free Packaging**

  CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

- **Storage of Semiconductor Devices**

  Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

  (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.

  (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
  When you open Dry Package that recommends humidity 40% to 70% relative humidity.

  (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.

  (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

- **Baking**

  Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

  Condition: 125°C/24 h

- **Static Electricity**

  Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

  (1) Maintain relative humidity in the working environment between 40% and 70%.
  Use of an apparatus for ion generation may be needed to remove electricity.

  (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.

  (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
  Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.

  (4) Ground all fixtures and instruments, or protect with anti-static measures.

  (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

8.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

9. Notes On Device Handling

- Preventing latch-ups
  When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.
  In a CMOS IC, if a voltage higher than V_{CC} or a voltage lower than V_{SS} is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in “20.1 Absolute Maximum Ratings” of “Electrical Characteristics” is applied to the V_{CC} pin or the V_{SS} pin, a latch-up may occur.
  When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

- Stabilizing supply voltage
  Supply voltage must be stabilized.
  A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the V_{CC} power supply voltage.
  As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in V_{CC} ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard V_{CC} value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

- Notes on using the external clock
  When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from sub-clock mode or stop mode.

10. Pin Connection

- Treatment of unused pins
  If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 kΩ. Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.

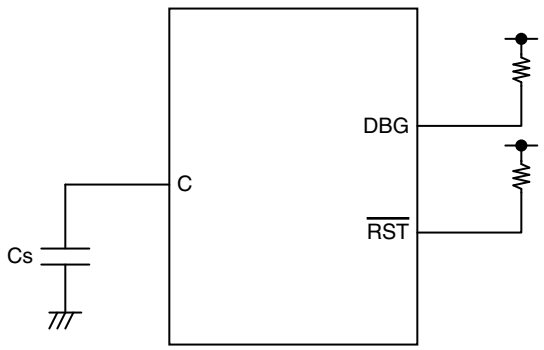
- Power supply pins
  To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the V_{CC} pin and the V_{SS} pin to the power supply and ground outside the device. In addition, connect the current supply source to the V_{CC} pin and the V_{SS} pin with low impedance.
  It is also advisable to connect a ceramic capacitor of approximately 0.1 µF as a bypass capacitor between the V_{CC} pin and the V_{SS} pin at a location close to this device.

- DBG pin
  Connect the DBG pin to an external pull-up resistor of 2 kΩ or above.
  After power-on, ensure that the DBG pin does not stay at “L” level until the reset output is released.
  The DBG pin becomes a communication pin in debug mode. Since the actual pull-up resistance depends on the tool used and the interconnection length, refer to the tool document when selecting a pull-up resistor.

- $\overline{RST}$ pin
  Connect the $\overline{RST}$ pin to an external pull-up resistor of 2 kΩ or above.
  To prevent the device from unintentionally entering the reset mode due to noise, minimize the interconnection length between a pull-up resistor and the $\overline{RST}$ pin and that between a pull-up resistor and the V_{CC} pin when designing the layout of the printed circuit board.
  The PF2/$\overline{RST}$ pin functions as the reset input/output pin after power-on. In addition, the reset output of the PF2/$\overline{RST}$ pin can be enabled by the RSTOE bit in the SYSC register, and the reset input function and the general purpose I/O function can be selected by the RSTEN bit in the SYSC register.

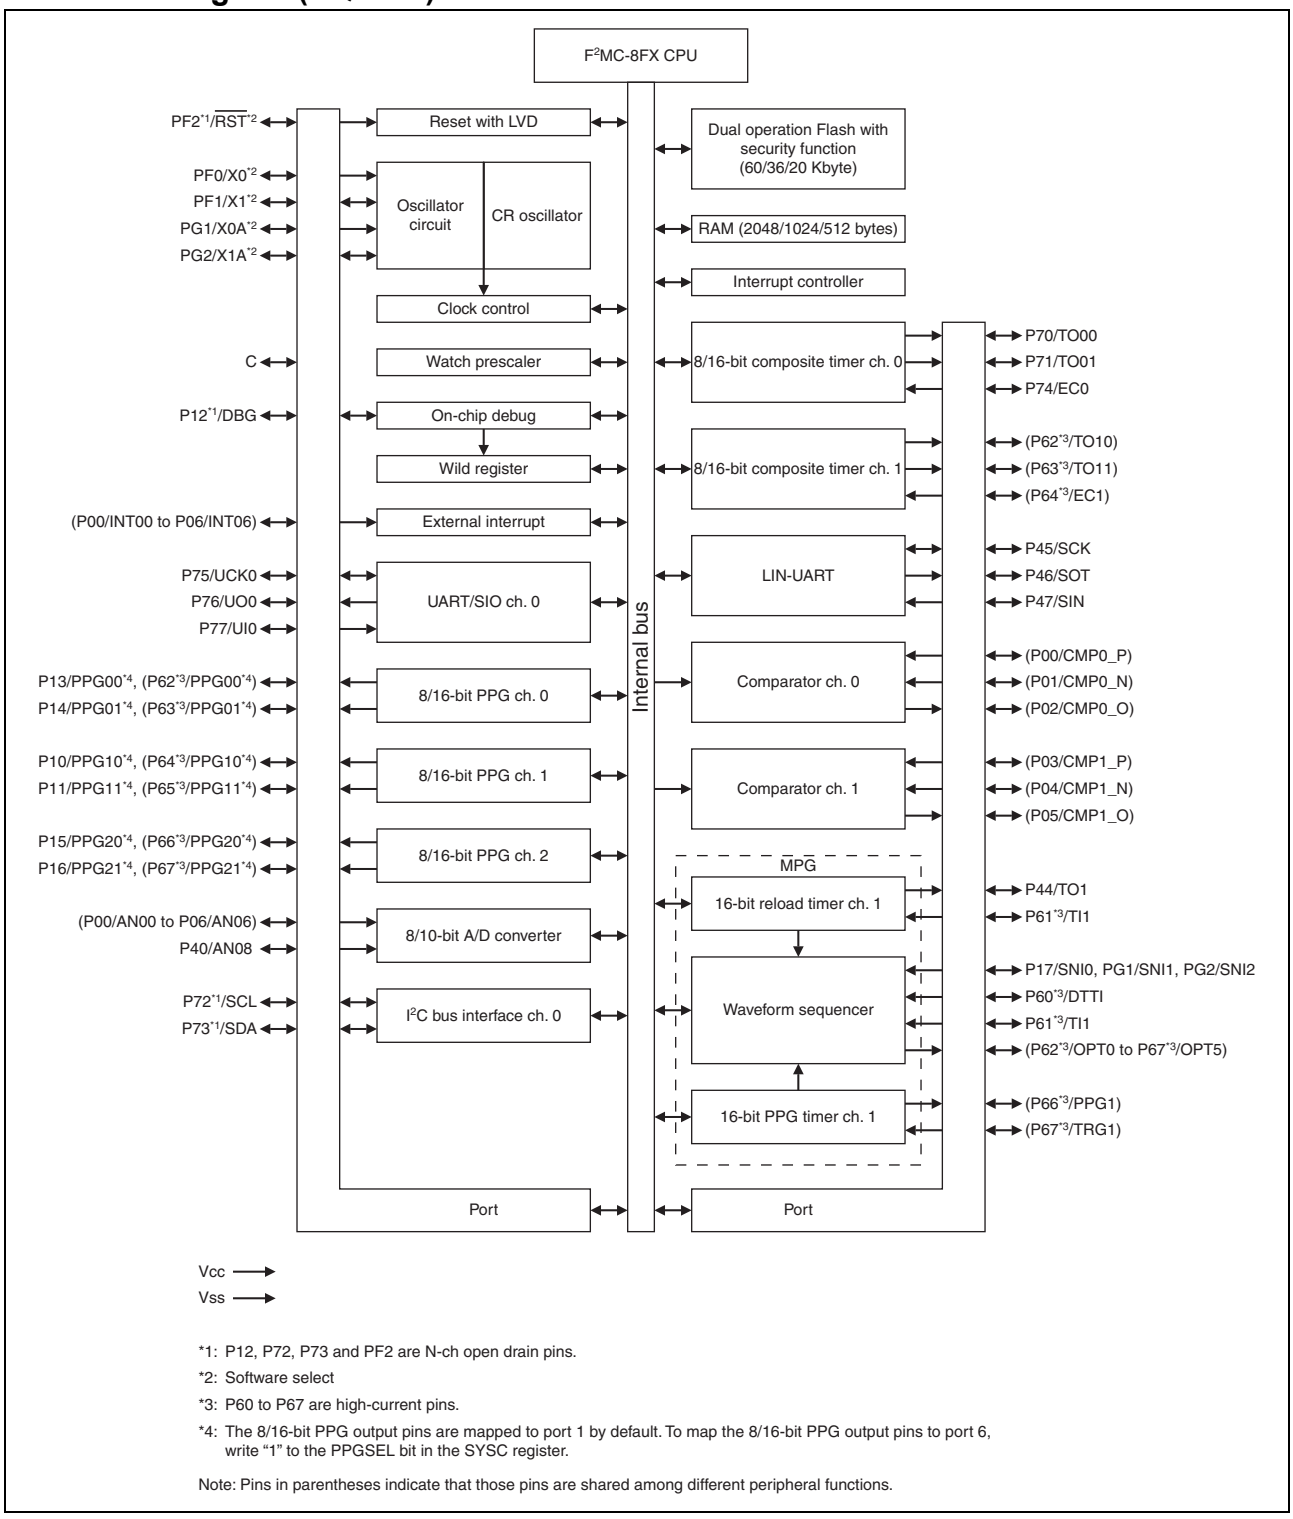
- C pin
  Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_S. For the connection to a decoupling capacitor C_S, see the diagram below. To prevent the device from unintentionally entering a mode to which the device is not set to transit due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

- DBG/$\overline{RST}$/C pins connection diagram



- Note on serial communication
  In serial communication, reception of wrong data may occur due to noise or other causes. Therefore, design a printed circuit board to prevent noise from occurring. Taking account of the reception of wrong data, take measures such as adding a checksum to the end of data in order to detect errors. If an error is detected, retransmit the data.

11. Block Diagram (LQF044)



*1: P12, P72, P73 and PF2 are N-ch open drain pins.

*2: Software select

*3: P60 to P67 are high-current pins.

*4: The 8/16-bit PPG output pins are mapped to port 1 by default. To map the 8/16-bit PPG output pins to port 6, write "1" to the PPGSEL bit in the SYSC register.

Note: Pins in parentheses indicate that those pins are shared among different peripheral functions.

12. Block Diagram (LQA048, LQC052, WNR048)

*2: Software select

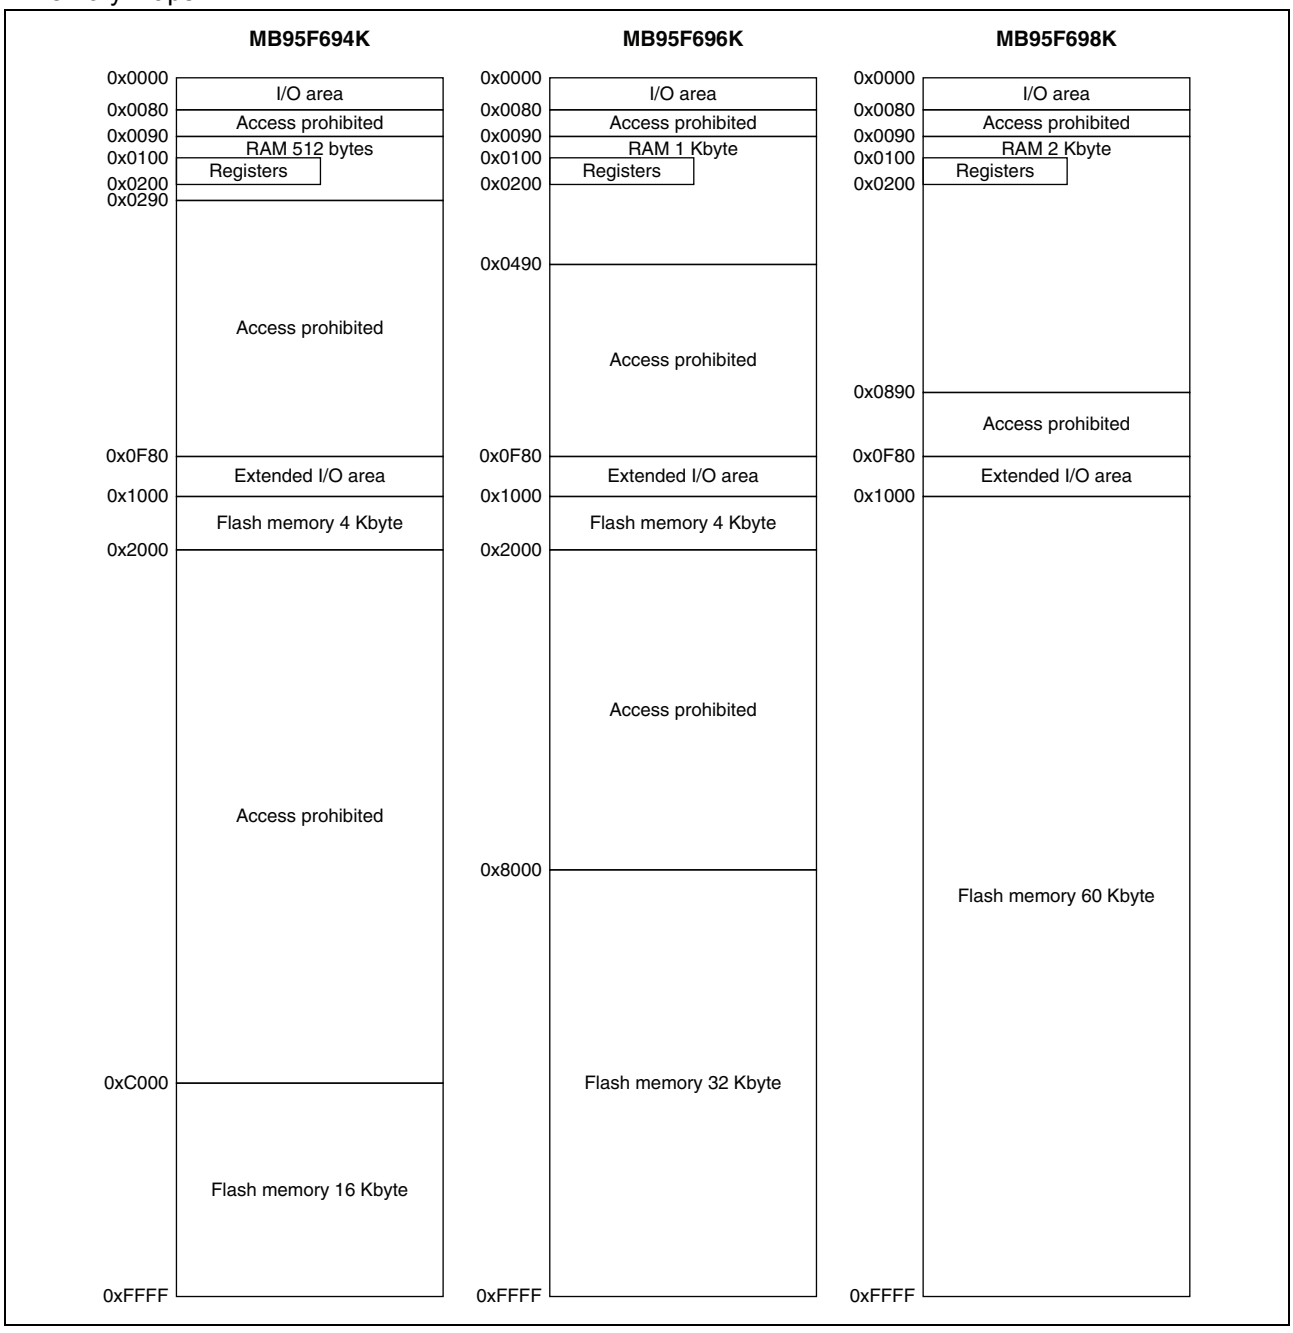
*3: P60 to P67 are high-current pins.

*4: The 8/16-bit PPG output pins are mapped to port 1 by default. To map the 8/16-bit PPG output pins to port 6, write "1" to the PPGSEL bit in the SYSC register.

Note: Pins in parentheses indicate that those pins are shared among different peripheral functions.

13. CPU Core

- Memory space
  The memory space of the MB95690K Series is 64 Kbyte in size, and consists of an I/O area, an extended I/O area, a data area, and a program area. The memory space includes areas intended for specific purposes such as general-purpose registers and a vector table. The memory maps of the MB95690K Series are shown below.
- Memory maps



14. Memory Space

The memory space of the MB95690K Series is 64 Kbyte in size, and consists of an I/O area, an extended I/O area, a data area, and a program area. The memory space includes areas for specific applications such as general-purpose registers and a vector table.

14.1 I/O area (addresses: 0x0000 to 0x007F)

- This area contains the control registers and data registers for built-in peripheral functions.
- As the I/O area forms part of the memory space, it can be accessed in the same way as the memory. It can also be accessed at high-speed by using direct addressing instructions.

14.2 Extended I/O area (addresses: 0x0F80 to 0x0FFF)

- This area contains the control registers and data registers for built-in peripheral functions.
- As the extended I/O area forms part of the memory space, it can be accessed in the same way as the memory.

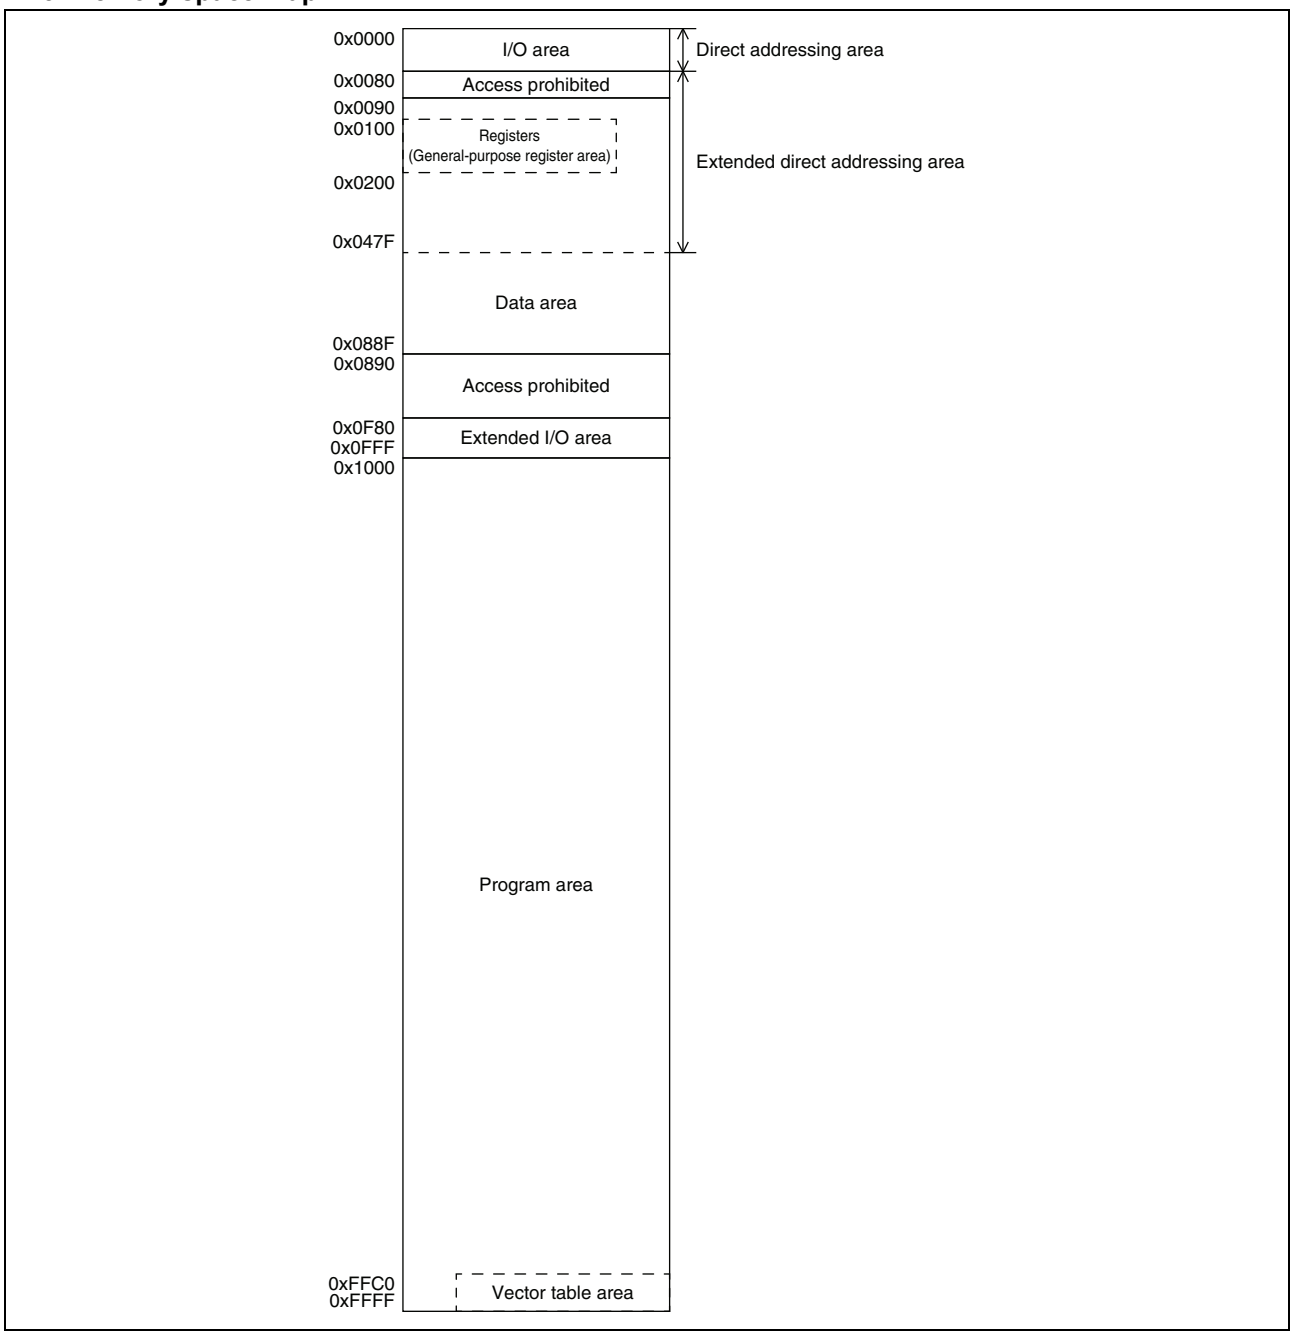
14.3 Data area

- Static RAM is incorporated in the data area as the internal data area.
- The internal RAM size varies according to product.
- The RAM area from 0x0090 to 0x00FF can be accessed at high-speed by using direct addressing instructions.
- In MB95F698K, the area from 0x0090 to 0x047F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
- In MB95F696K, the area from 0x0090 to 0x047F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
- In MB95F694K, the area from 0x0090 to 0x028F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
- In MB95F694K/F696K/F698K, the area from 0x0100 to 0x01FF can be used as a general-purpose register area.

14.4 Program area

- The Flash memory is incorporated in the program area as the internal program area.
- The Flash memory size varies according to product.
- The area from 0xFFC0 to 0xFFFF is used as the vector table.
- The area from 0xFFBB to 0xFFBF is used to store data of the non-volatile register.

14.5 Memory space map



15. Areas For Specific Applications

The general-purpose register area and vector table area are used for the specific applications.

- General-purpose register area (Addresses: 0x0100 to 0x01FF)
  - This area contains the auxiliary registers used for 8-bit arithmetic operations, transfer, etc.
  - As this area forms part of the RAM area, it can also be used as conventional RAM.
  - When the area is used as general-purpose registers, general-purpose register addressing enables high-speed access with short instructions.

- Non-volatile register data area (Addresses: 0xFFBB to 0xFFBF)
  - The area from 0xFFBB to 0xFFBF is used to store data of the non-volatile register. For details, refer to “CHAPTER 27 NON-VOLATILE REGISTER (NVR) INTERFACE” in “New 8FX MB95690K Series Hardware Manual”.

- Vector table area (Addresses: 0xFFC0 to 0xFFFF)
  - This area is used as the vector table for vector call instructions (CALLV), interrupts, and resets.
  - The top of the Flash memory area is allocated to the vector table area. The start address of a service routine is set to an address in the vector table in the form of data.

  “Interrupt Source Table” lists the vector table addresses corresponding to vector call instructions, interrupts, and resets.
  For details, refer to “CHAPTER 4 RESET”, “CHAPTER 5 INTERRUPTS” and “A.2 Special Instruction ■ Special Instruction ● CALLV #vct” in “APPENDIX” in “New 8FX MB95690K Series Hardware Manual”.

- Direct bank pointer and access area

Direct bank pointer (DP[2:0])	Operand-specified dir	Access area
0bXXX (It does not affect mapping.)	0x0000 to 0x007F	0x0000 to 0x007F
0b000 (initial value)	0x0090 to 0x00FF	0x0090 to 0x00FF
0b001	0x0080 to 0x00FF	0x0100 to 0x017F
0b010		0x0180 to 0x01FF
0b011		0x0200 to 0x027F
0b100		0x0280 to 0x02FF*1
0b101		0x0300 to 0x037F
0b110		0x0380 to 0x03FF
0b111		0x0400 to 0x047F*2

*1: Due to the memory size limit, the available access area is up to “0x028F” in MB95F694K.
*2: Due to the memory size limit, the available access area is up to “0x047F” in MB95F696K/F698K.

- R/W access symbols
  R/W : Readable/Writable
  R : Read only
- Initial value symbols
  0 : The initial value of this bit is “0”.
  1 : The initial value of this bit is “1”.
  X : The initial value of this bit is undefined.

Note: Do not write to an address that is “(Disabled)”. If a “(Disabled)” address is read, an indeterminate value is returned.

17. I/O Ports

- List of port registers

Register name		Read/Write	Initial value
Port 0 data register	PDR0	R, RM/W	0b00000000
Port 0 direction register	DDR0	R/W	0b00000000
Port 1 data register	PDR1	R, RM/W	0b00000000
Port 1 direction register	DDR1	R/W	0b00000000
Port 4 data register	PDR4	R, RM/W	0b00000000
Port 4 direction register	DDR4	R/W	0b00000000
Port 6 data register	PDR6	R, RM/W	0b00000000
Port 6 direction register	DDR6	R/W	0b00000000
Port 7 data register	PDR7	R, RM/W	0b00000000
Port 7 direction register	DDR7	R/W	0b00000000
Port F data register	PDRF	R, RM/W	0b00000000
Port F direction register	DDRF	R/W	0b00000000
Port G data register	PDRG	R, RM/W	0b00000000
Port G direction register	DDRG	R/W	0b00000000
Port 0 pull-up register	PUL0	R/W	0b00000000
Port 1 pull-up register	PUL1	R/W	0b00000000
Port 4 pull-up register	PUL4	R/W	0b00000000
Port 6 pull-up register	PUL6	R/W	0b00000000
Port 7 pull-up register	PUL7	R/W	0b00000000
Port G pull-up register	PULG	R/W	0b00000000
A/D input disable register (upper)	AIDRH	R/W	0b00000000
A/D input disable register (lower)	AIDRL	R/W	0b00000000

R/W : Readable/writable (The read value is the same as the write value.)
R, RM/W : Readable/writable (The read value is different from the write value. The write value is read by the read-modify-write (RMW) type of instruction.)

17.1 Port 0

Port 0 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.1.1 Port 0 configuration

Port 0 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 0 data register (PDR0)
- Port 0 direction register (DDR0)
- Port 0 pull-up register (PUL0)
- A/D input disable register (lower) (AIDRL)

17.1.2 Block diagrams of port 0

- P00/INT00/AN00/CMP0_P pin

  This pin has the following peripheral functions:
  - External interrupt input pin (INT00)
  - 8/10-bit A/D converter analog input pin (AN00)
  - Comparator ch. 0 non-inverting analog input (positive input) pin (CMP0_P)

- P01/INT01/AN01/CMP0_N pin

  This pin has the following peripheral functions:
  - External interrupt input pin (INT01)
  - 8/10-bit A/D converter analog input pin (AN01)
  - Comparator ch. 0 inverting analog input (negative input) pin (CMP0_N)

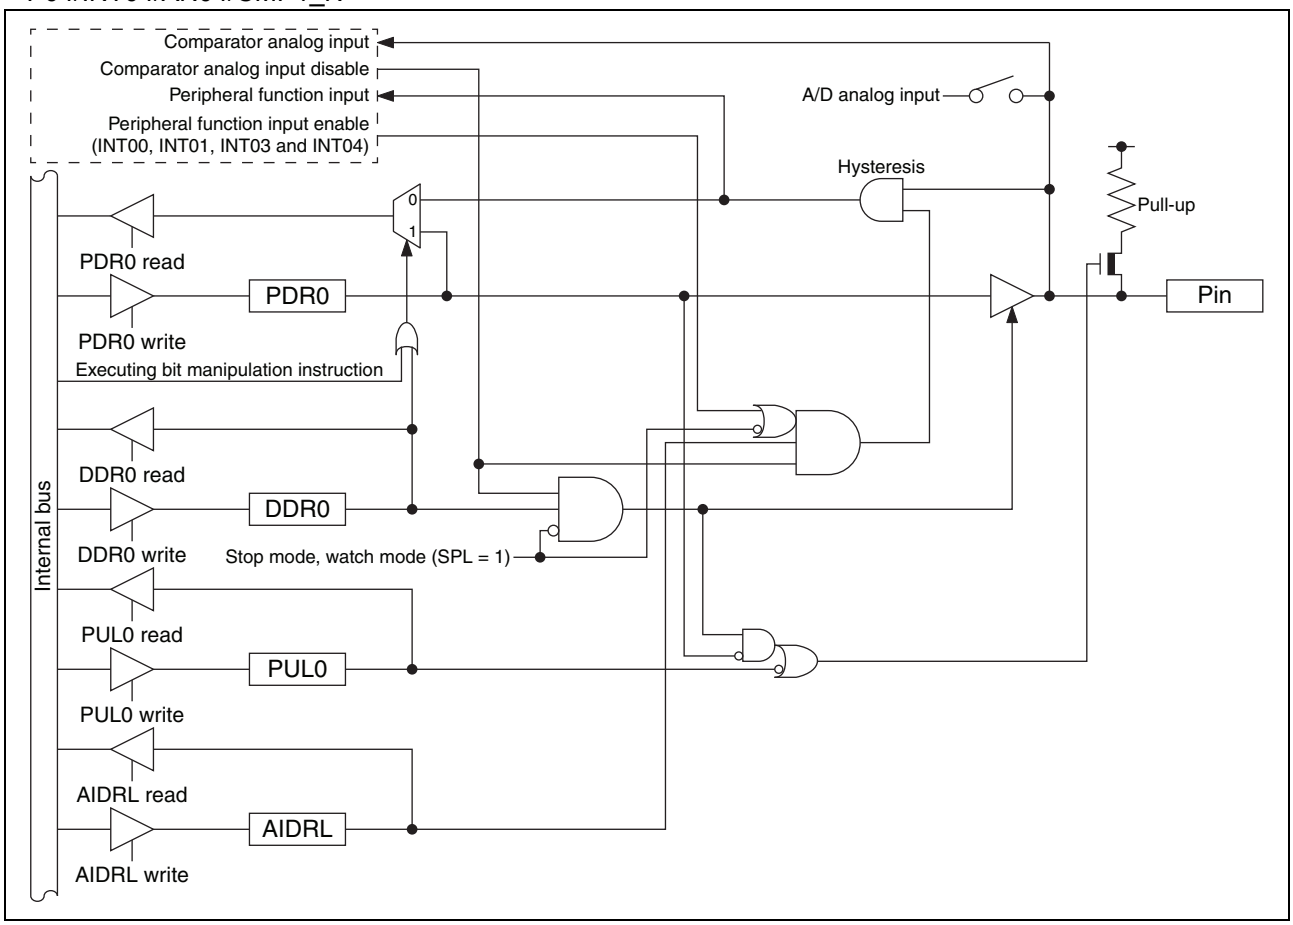
- P03/INT03/AN03/CMP1_P pin

  This pin has the following peripheral functions:
  - External interrupt input pin (INT03)
  - 8/10-bit A/D converter analog input pin (AN03)
  - Comparator ch. 1 non-inverting analog input (positive input) pin (CMP1_P)

- P04/INT04/AN04/CMP1_N pin

  This pin has the following peripheral functions:
  - External interrupt input pin (INT04)
  - 8/10-bit A/D converter analog input pin (AN04)
  - Comparator ch. 1 inverting analog input (negative input) pin (CMP1_N)

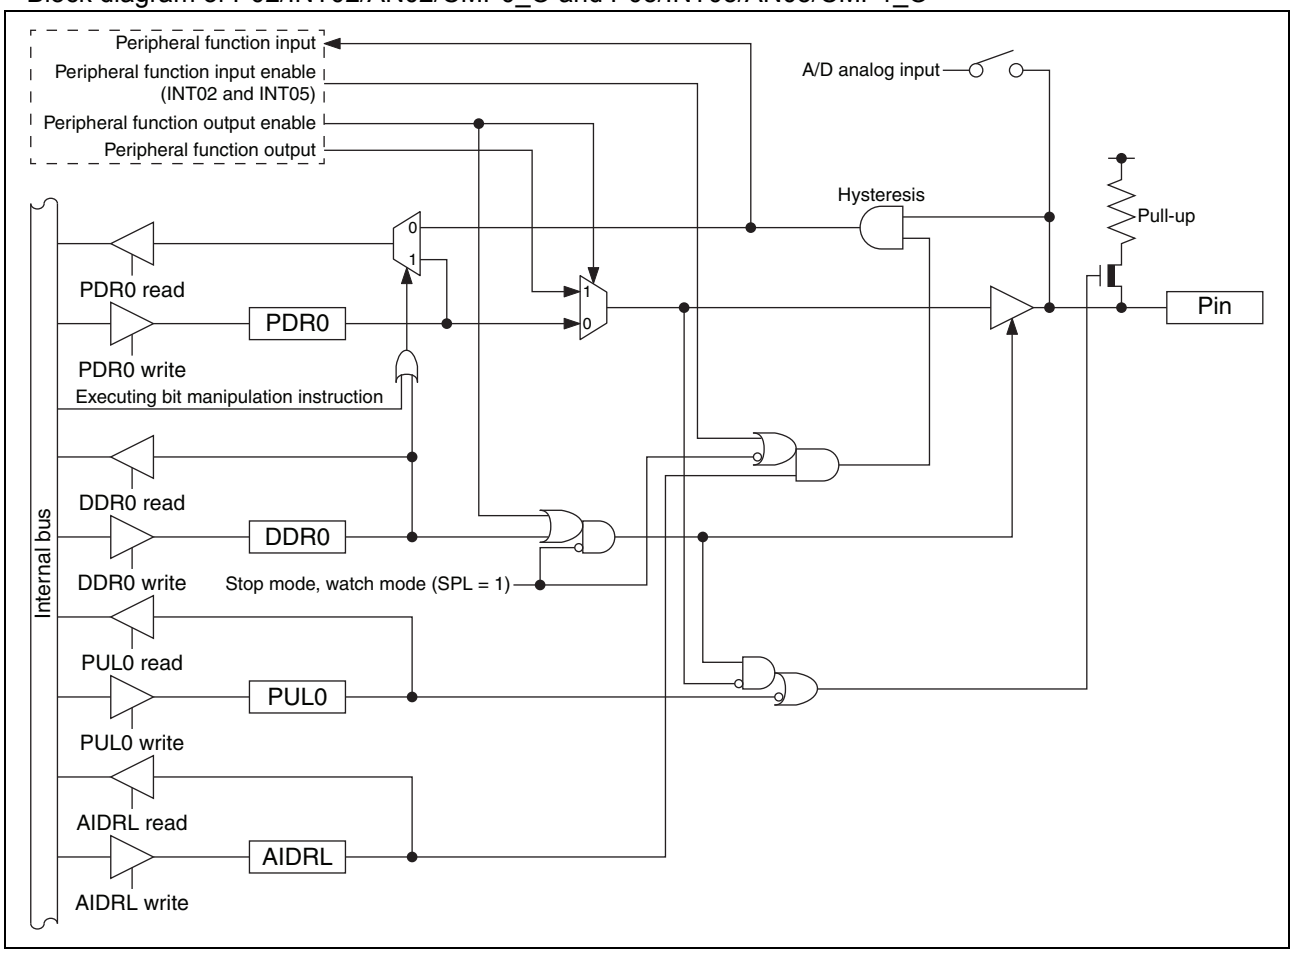
- Block diagram of P00/INT00/AN00/CMP0_P, P01/INT01/AN01/CMP0_N, P03/INT03/AN03/CMP1_P and P04/INT04/AN04/CMP1_N



- P02/INT02/AN02/CMP0_O pin
  This pin has the following peripheral functions:
  - External interrupt input pin (INT02)
  - 8/10-bit A/D converter analog input pin (AN02)
  - Comparator ch. 0 digital output pin (CMP0_O)

- P05/INT05/AN05/CMP1_O pin
  This pin has the following peripheral functions:
  - External interrupt input pin (INT05)
  - 8/10-bit A/D converter analog input pin (AN05)
  - Comparator ch. 1 digital output pin (CMP1_O)

- Block diagram of P02/INT02/AN02/CMP0_O and P05/INT05/AN05/CMP1_O



- P06/INT06/AN06 pin
  This pin has the following peripheral functions:
  - External interrupt input pin (INT06)
  - 8/10-bit A/D converter analog input pin (AN06)

- P07/INT07/AN07 pin
  This pin has the following peripheral functions:
  - External interrupt input pin (INT07)
  - 8/10-bit A/D converter analog input pin (AN07)

PDR0	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
DDR0								
PUL0								
AIDRL								

17.1.4 Port 0 operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDR0 register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDR0 register to external pins.
  - If data is written to the PDR0 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDR0 register returns the PDR0 register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDR0 register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When using a pin shared with the analog input function as an input port, set the corresponding bit in the A/D input disable register (lower) (AIDRL) to “1”.
  - If data is written to the PDR0 register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDR0 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.

- Operation as a peripheral function output pin
  - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
  - The pin value can be read from the PDR0 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR0 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDR0 register corresponding to the input pin of a peripheral function to “0”.
  - When using a pin shared with the analog input function as another peripheral function input pin, configure it as an input port by setting the bit in the AIDRL register corresponding to that pin to “1”.
  - Reading the PDR0 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDR0 register are initialized to “0” and port input is enabled. As for a pin shared with the analog input function, its port input is disabled because the AIDRL register is initialized to “0”.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR0 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input is enabled for the external interrupt (INT00 to INT07), the input is enabled and not blocked.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation as an analog input pin
  - Set the bit in the DDR0 register bit corresponding to the analog input pin to “0” and the bit corresponding to that pin in the AIDRL register to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions. In addition, set the

corresponding bit in the PUL0 register to “0”.

- Operation as an external interrupt input pin
  - Set the bit in the DDR0 register corresponding to the external interrupt input pin to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - The pin value is always input to the external interrupt circuit. When using a pin for a function other than the interrupt, disable the external interrupt function corresponding to that pin.

- Operation of the pull-up register
  Setting the bit in the PUL0 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL0 register.

- Operation as a comparator input pin (only for P00 and P03)
  - Set the bit in the AIDRL register corresponding to the comparator input pin to “0”.
  - Regardless of the value of the PDR0 register and that of the DDR0 register, if the comparator analog input enable bit in the comparator control register ch. 0/ch. 1 (CMR0/CMR1:VCID) is set to “0”, the comparator input function is enabled.
  - To disable the comparator input function, set the VCID bit to “1”.
  - For details of the comparator, refer to “CHAPTER 28 COMPARATOR” in “New 8FX MB95690K Series Hardware Manual”.

- Operation as a comparator input pin (only for P01 and P04)
  - Set the bit in the AIDRL register corresponding to the comparator input pin to “0”.
  - Regardless of the value of the PDR0 register and that of the DDR0 register, if the comparator analog input enable bit (VCID) and the negative analog input voltage source select bit (BGRS) in the comparator control register ch. 0/ch. 1 (CMR0/CMR1) are both set to “0”, the comparator input function is enabled.
  - To disable the comparator input function, set the VCID bit or the BGRS bit to “1”.
  - For details of the comparator, refer to “CHAPTER 28 COMPARATOR” in “New 8FX MB95690K Series Hardware Manual”.

17.2 Port 1

Port 1 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.2.1 Port 1 configuration

Port 1 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 1 data register (PDR1)
- Port 1 direction register (DDR1)
- Port 1 pull-up register (PUL1)

17.2.2 Block diagrams of port 1

- P10/PPG10* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 1 output pin (PPG10)

- P11/PPG11* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 1 output pin (PPG11)

- P13/PPG00* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 0 output pin (PPG00)

- P14/PPG01* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 0 output pin (PPG01)

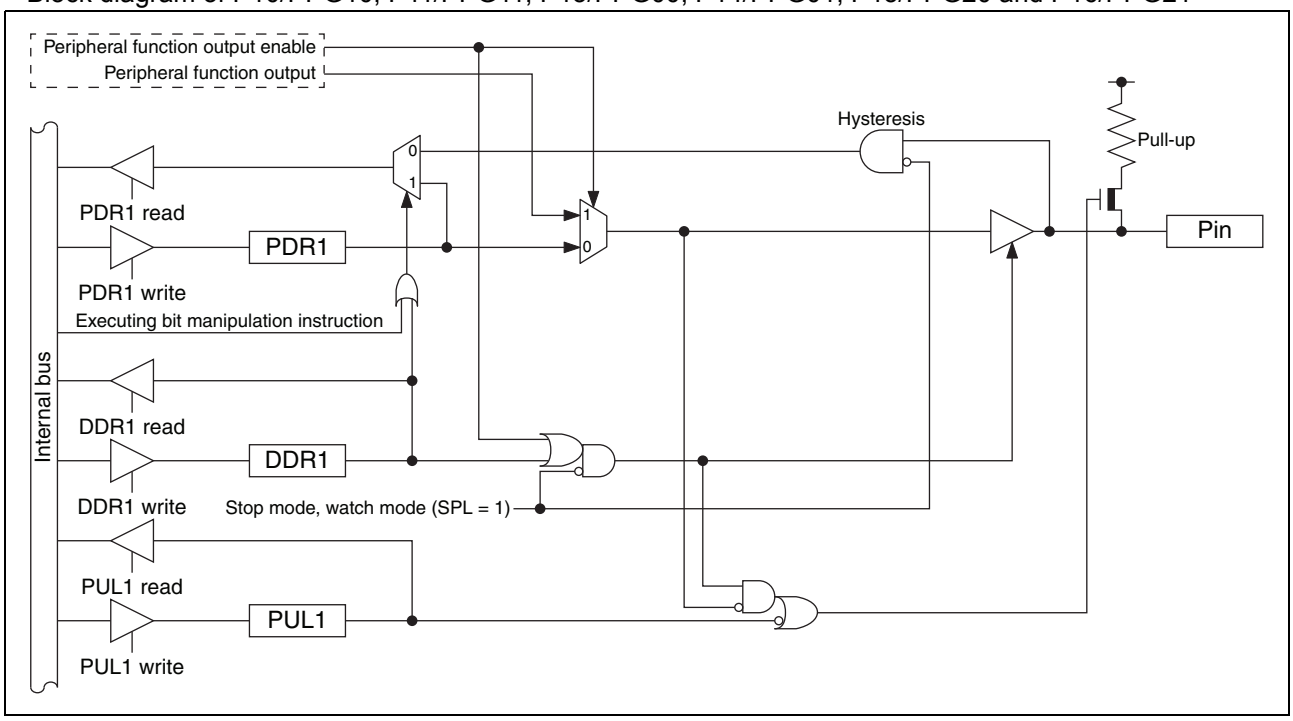
- P15/PPG20* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 2 output pin (PPG20)

- P16/PPG21* pin
  This pin has the following peripheral function:
  - 8/16-bit PPG ch. 2 output pin (PPG21)

*: The 8/16-bit PPG output pins are mapped to pins according to the setting of the PPGSEL bit in the SYSC register. See the table below for details.

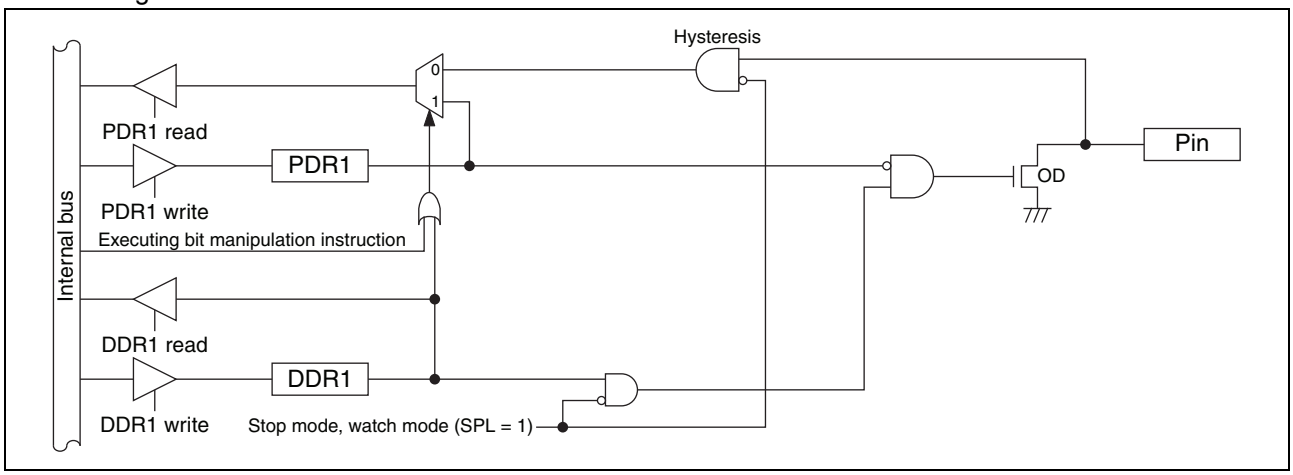
8/16-bit PPG output pin	SYSC:PPGSEL = 0	SYSC:PPGSEL = 1
	Pin	
PPG00	P13	P62
PPG01	P14	P63
PPG10	P10	P64
PPG11	P11	P65
PPG20	P15	P66
PPG21	P16	P67

- Block diagram of P10/PPG10, P11/PPG11, P13/PPG00, P14/PPG01, P15/PPG20 and P16/PPG21



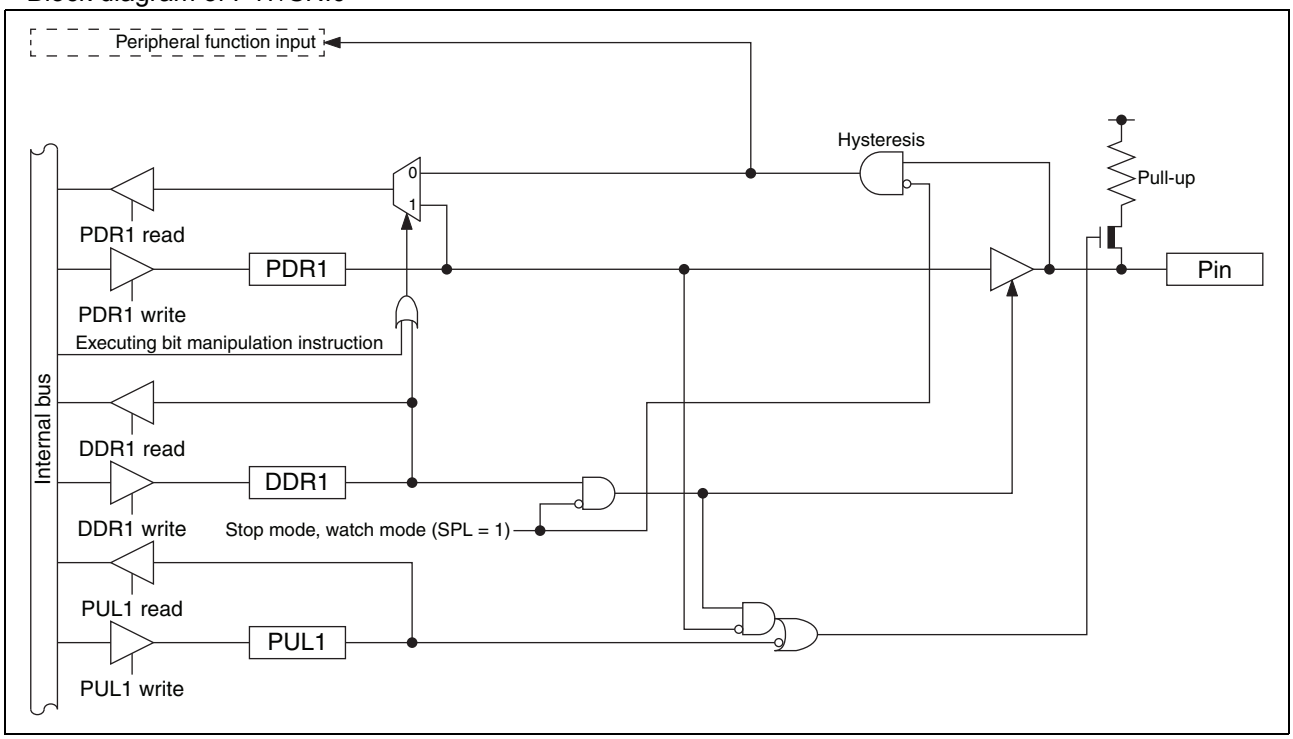
- P12/DBG pin
  This pin has the following peripheral function:
  - DBG input pin (DBG)

- Block diagram of P12/DBG



- P17/SNI0 pin
  This pin has the following peripheral function:
  - Trigger input pin for the position detection function of the MPG waveform sequencer (SNI0)

- Block diagram of P17/SNI0



17.2.3 Port 1 registers

- Port 1 register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDR1	0	Pin state is “L” level.	PDR1 value is “0”.	As output port, outputs “L” level.
	1	Pin state is “H” level.	PDR1 value is “1”.	As output port, outputs “H” level.*
DDR1	0	Port input enabled		
	1	Port output enabled		
PUL1	0	Pull-up disabled		
	1	Pull-up enabled		

*: If the pin is an N-ch open drain pin, the pin state becomes Hi-Z.

- Correspondence between registers and pins for port 1

	Correspondence between related register bits and pins							
Pin name	P17	P16	P15	P14	P13	P12	P11	P10
PDR1	bit7	bit6	bit5	bit4	bit3	bit2*	bit1	bit0
DDR1								
PUL1								

*: Though P12 has no pull-up function, bit2 in the PUL1 register can still be accessed. The operation of P12 is not affected by the setting of bit2 in the PUL1 register.

17.2.4 Port 1 operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDR1 register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDR1 register to external pins.
  - If data is written to the PDR1 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDR1 register returns the PDR1 register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDR1 register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - If data is written to the PDR1 register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDR1 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.

- Operation as a peripheral function output pin
  - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
  - The pin value can be read from the PDR1 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR1 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDR1 register corresponding to the input pin of a peripheral function to “0”.
  - Reading the PDR1 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDR1 register are initialized to “0” and port input is enabled.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR1 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation of the pull-up register
  Setting the bit in the PUL1 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL1 register.

17.3 Port 4

Port 4 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.3.1 Port 4 configuration

Port 4 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 4 data register (PDR4)
- Port 4 direction register (DDR4)
- Port 4 pull-up register (PUL4)
- A/D input disable register (upper) (AIDRH)

17.3.2 Block diagrams of port 4

- P40/AN08 pin

  This pin has the following peripheral function:
  - 8/10-bit A/D converter analog input pin (AN08)

- P41/AN09 pin

  This pin has the following peripheral function:
  - 8/10-bit A/D converter analog input pin (AN09)

- P42/AN10 pin

  This pin has the following peripheral function:
  - 8/10-bit A/D converter analog input pin (AN10)

- P43/AN11 pin

  This pin has the following peripheral function:
  - 8/10-bit A/D converter analog input pin (AN11)

DDR4								
PUL4								
AIDRH	-	-	-	-				

17.3.4 Port 4 operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDR4 register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDR4 register to external pins.
  - If data is written to the PDR4 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDR4 register returns the PDR4 register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDR4 register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When using a pin shared with the analog input function as an input port, set the corresponding bit in the A/D input disable register (upper) (AIDRH) to “1”
  - If data is written to the PDR4 register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDR4 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.

- Operation as a peripheral function output pin
  - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
  - The pin value can be read from the PDR4 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR4 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDR4 register corresponding to the input pin of a peripheral function to “0”.
  - When using a pin shared with the analog input function as another peripheral function input pin, configure it as an input port by setting the bit in the AIDRH register corresponding to that pin to “1”.
  - Reading the PDR4 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDR4 register are initialized to “0” and port input is enabled. As for a pin shared with the analog input function, its port input is disabled because the AIDRH register is initialized to “0”.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR4 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P45/SCK and P47/SIN is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation as an analog input pin
  - Set the bit in the DDR4 register bit corresponding to the analog input pin to “0” and the bit corresponding to that pin in the AIDRH register to “0”.

- For a pin shared with other peripheral functions, disable the output of such peripheral functions. In addition, set the corresponding bit in the PUL4 register to “0”.

- Operation of the pull-up register
  Setting the bit in the PUL4 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL4 register.

17.4 Port 6

Port 6 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.4.1 Port 6 configuration

Port 6 is made up of the following elements.

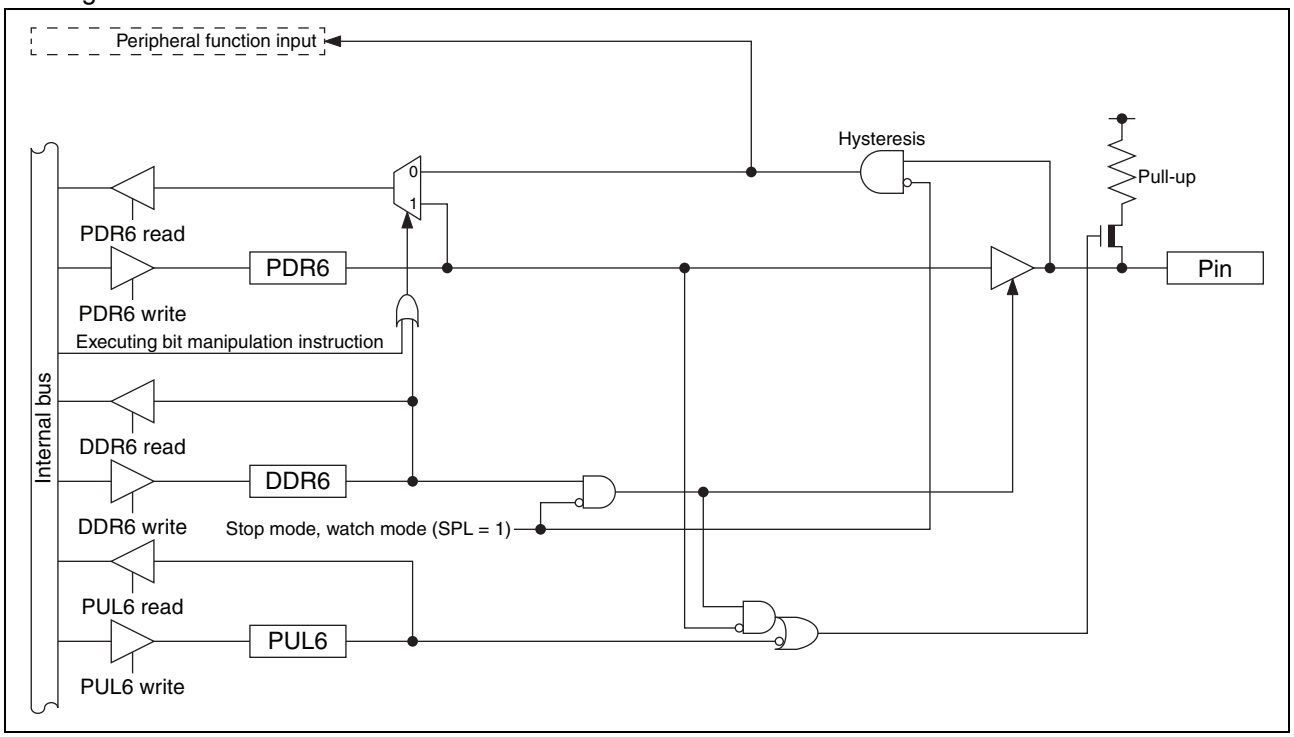
- General-purpose I/O pins/peripheral function I/O pins
- Port 6 data register (PDR6)
- Port 6 direction register (DDR6)
- Port 6 pull-up register (PUL6)

17.4.2 Block diagrams of port 6

- P60/DTTI pin
  This pin has the following peripheral function:
  - MPG waveform sequencer input pin (DTTI)

- P61/TI1 pin
  This pin has the following peripheral function:
  - 16-bit reload timer ch. 1 input pin (TI1)

- Block diagram of P60/DTTI and P61/TI1



- P62/OPT0/PPG00/TO10 pin
  This pin has the following peripheral functions:
  - MPG waveform sequencer output pin (OPT0)
  - 8/16-bit PPG ch. 0 output pin (PPG00)
  - 8/16-bit composite timer ch. 1 output pin (TO10)

- P63/OPT1/PPG01/TO11 pin
  This pin has the following peripheral functions:
  - MPG waveform sequencer output pin (OPT1)
  - 8/16-bit PPG ch. 0 output pin (PPG01)
  - 8/16-bit composite timer ch. 1 output pin (TO11)

- P65/OPT3/PPG11 pin
  This pin has the following peripheral functions:
  - MPG waveform sequencer output pin (OPT3)
  - 8/16-bit PPG ch. 1 output pin (PPG11)

- P66/OPT4/PPG20/PPG1 pin
  This pin has the following peripheral functions:
  - MPG waveform sequencer output pin (OPT4)
  - 8/16-bit PPG ch. 2 output pin (PPG20)
  - 16-bit PPG timer ch. 1 output pin (PPG1)

DDR6								
PUL6								

17.4.4 Port 6 operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDR6 register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDR6 register to external pins.
  - If data is written to the PDR6 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDR6 register returns the PDR6 register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDR6 register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - If data is written to the PDR6 register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDR6 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.

- Operation as a peripheral function output pin
  - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
  - The pin value can be read from the PDR6 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR6 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDR6 register corresponding to the input pin of a peripheral function to “0”.
  - Reading the PDR6 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDR6 register are initialized to “0” and port input is enabled.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR6 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P64/EC1 and P67/TRG1 is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation of the pull-up register
  Setting the bit in the PUL6 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL6 register.

17.5 Port 7

Port 7 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.5.1 Port 7 configuration

Port 7 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 7 data register (PDR7)
- Port 7 direction register (DDR7)
- Port 7 pull-up register (PUL7)

17.5.2 Block diagrams of port 7

- P70/TO00 pin

  This pin has the following peripheral function:
  - 8/16-bit composite time ch. 0 output pin (TO00)

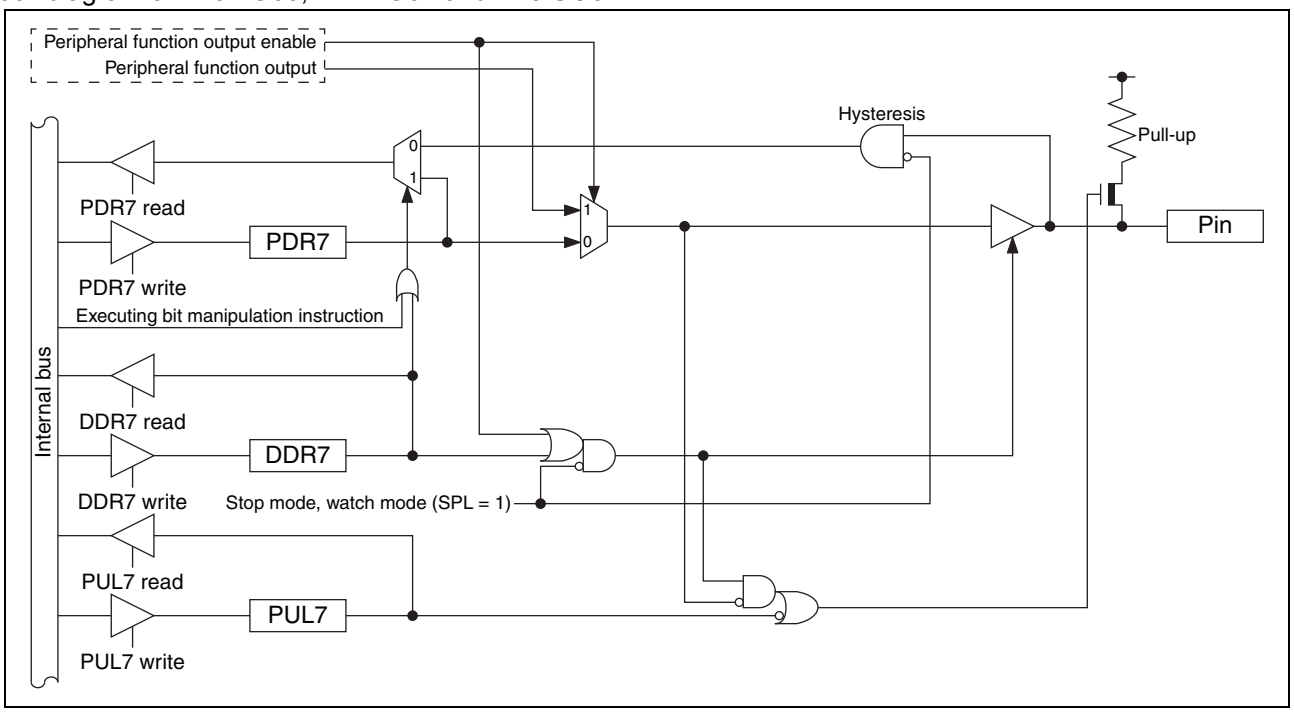
- P71/TO01 pin

  This pin has the following peripheral function:
  - 8/16-bit composite timer ch. 0 output pin (TO01)

- P76/UO0 pin

  This pin has the following peripheral function:
  - UART/SIO ch. 0 data output pin (UO0)

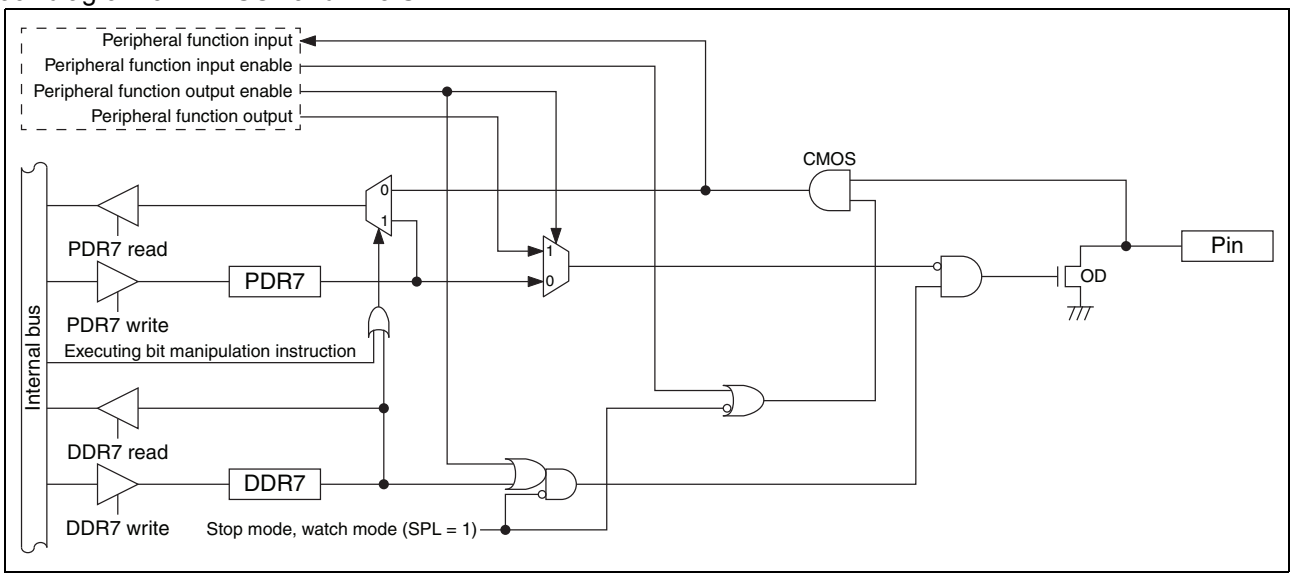
- Block diagram of P70/TO00, P71/TO01 and P76/UO0



- P72/SCL pin
  This pin has the following peripheral function:
  - I²C bus interface ch. 0 clock I/O pin (SCL)

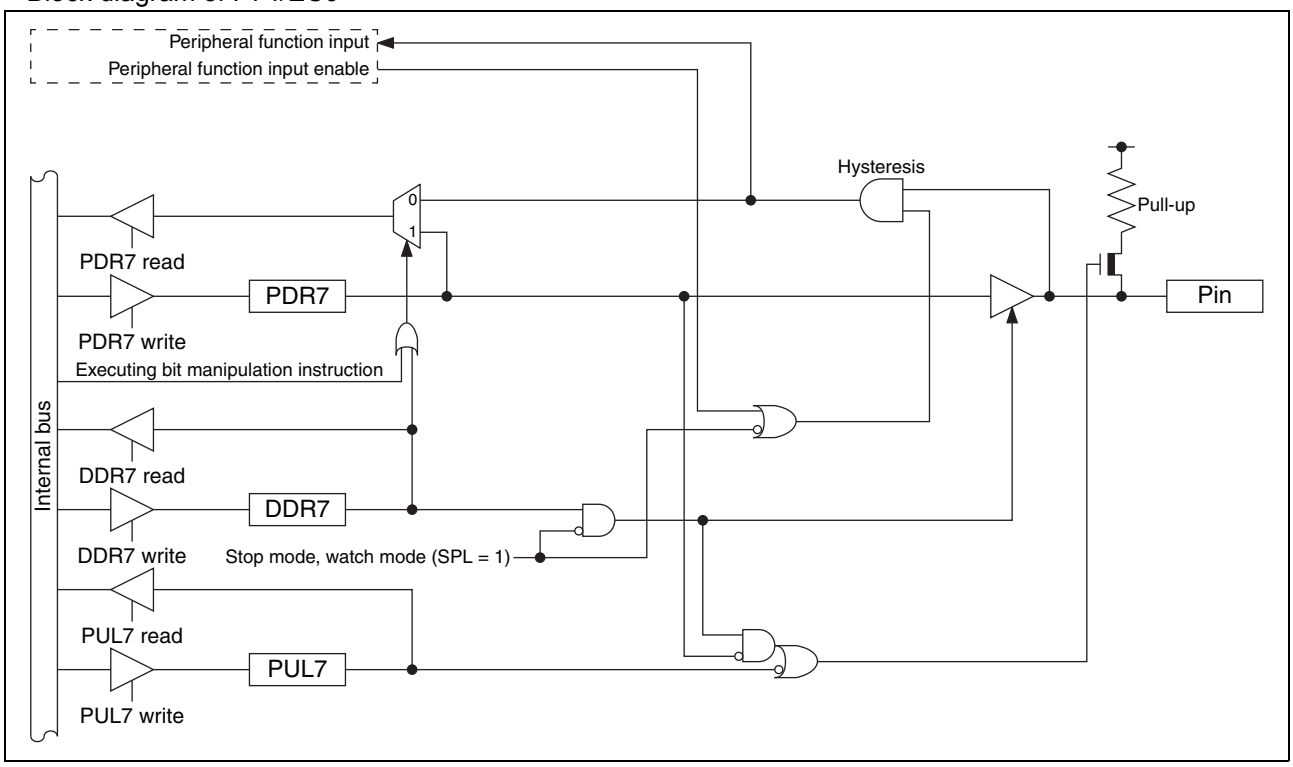
- P73/SDA pin
  This pin has the following peripheral function:
  - I²C bus interface ch. 0 data I/O pin (SDA)

- Block diagram of P72/SCL and P73/SDA



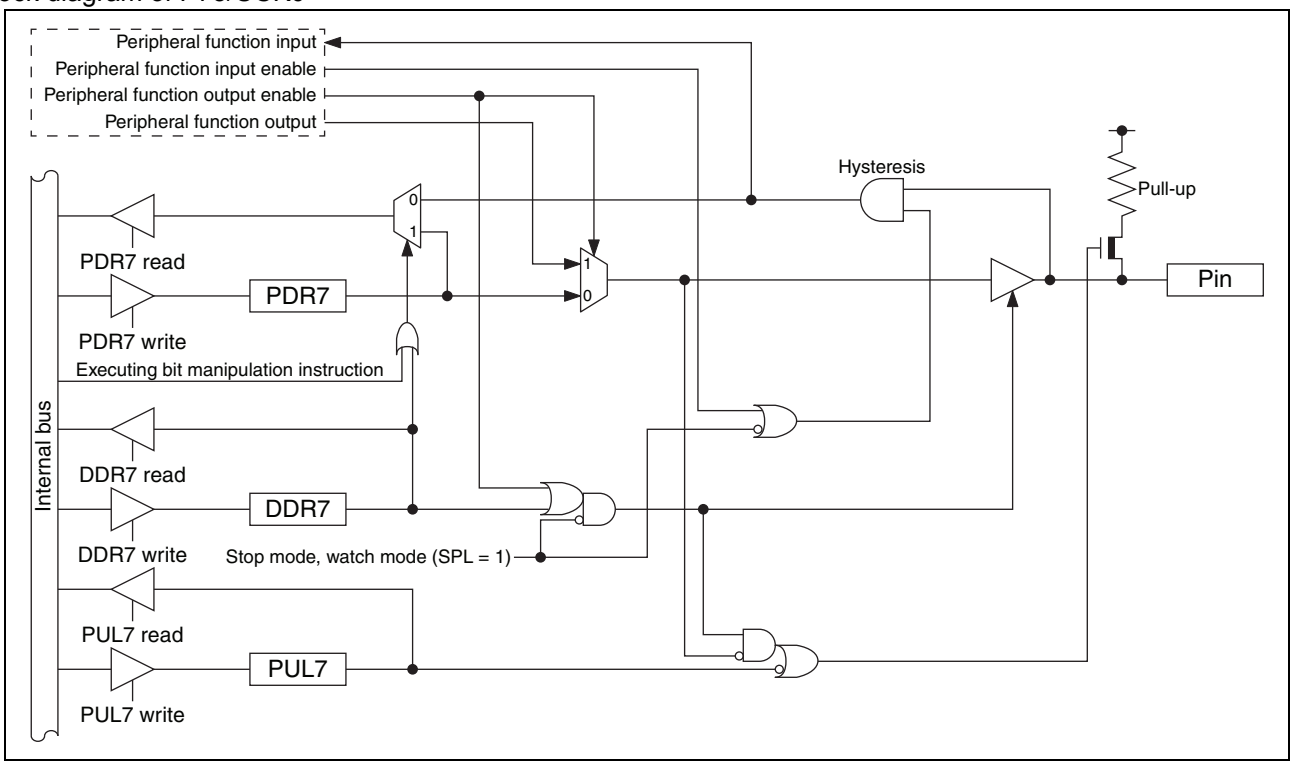
- P74/EC0 pin
  This pin has the following peripheral functions:
  - 8/16-bit composite timer ch. 0 clock input pin (EC0)

- Block diagram of P74/EC0



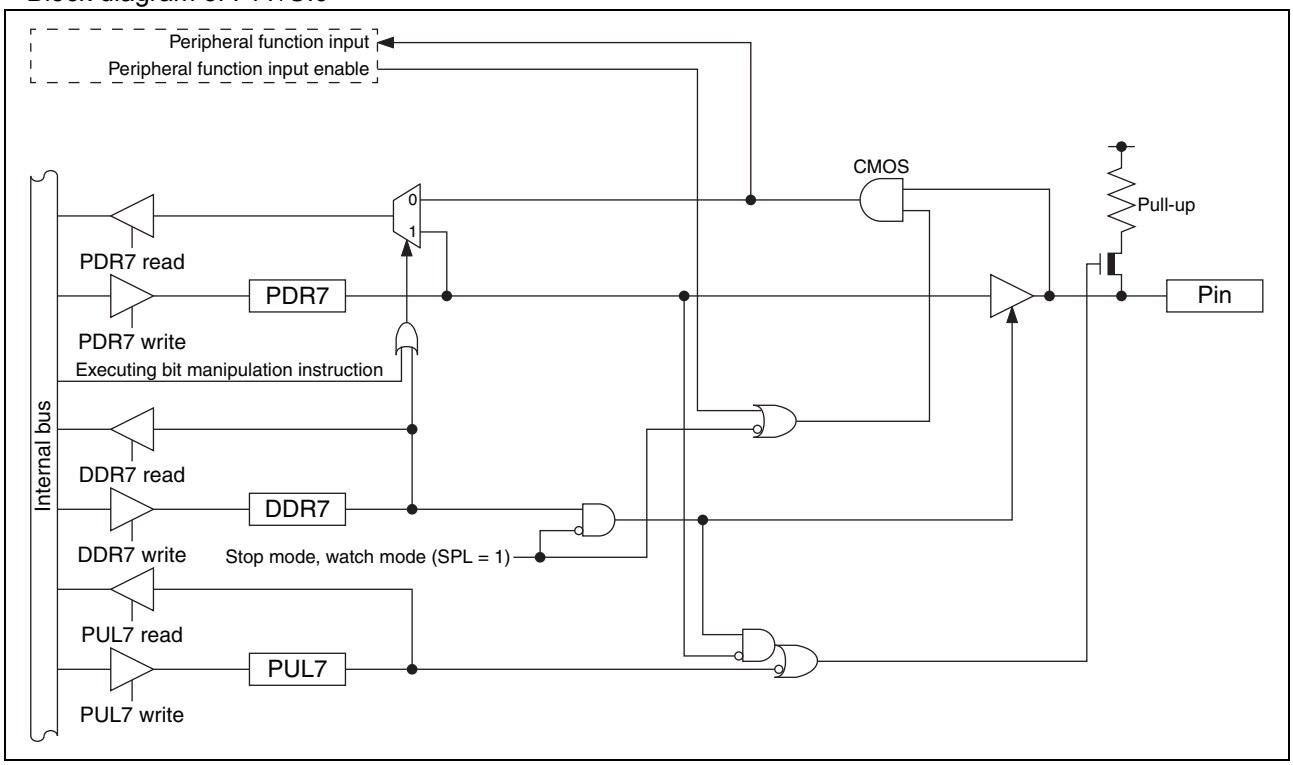
- P75/UCK0 pin
  This pin has the following peripheral function:
  - UART/SIO ch. 0 clock I/O pin (UCK0)

- Block diagram of P75/UCK0



- P77/UI0 pin
  This pin has the following peripheral function:
  - UART/SIO ch. 0 data input pin (UI0)

- Block diagram of P77/UI0



17.5.3 Port 7 registers

• Port 7 register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDR7	0	Pin state is “L” level.	PDR7 value is “0”.	As output port, outputs “L” level.
	1	Pin state is “H” level.	PDR7 value is “1”.	As output port, outputs “H” level.*
DDR7	0	Port input enabled		
	1	Port output enabled		
PUL7	0	Pull-up disabled		
	1	Pull-up enabled		

*: If the pin is an N-ch open drain pin, the pin state becomes Hi-Z.

• Correspondence between registers and pins for port 7

	Correspondence between related register bits and pins							
Pin name	**P77**	**P76**	**P75**	**P74**	**P73**	**P72**	**P71**	**P70**
PDR7	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
DDR7								
PUL7					-	-		

17.5.4 Port 7 operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDR7 register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDR7 register to external pins.
  - If data is written to the PDR7 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDR7 register returns the PDR7 register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDR7 register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - If data is written to the PDR7 register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDR7 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.

- Operation as a peripheral function output pin
  - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
  - The pin value can be read from the PDR7 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR7 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDR7 register corresponding to the input pin of a peripheral function to “0”.
  - Reading the PDR7 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDR7 register are initialized to “0” and port input is enabled.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR7 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P74/EC0, P75/UCK0 and P77/UI0 is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation of the pull-up register
  Setting the bit in the PUL7 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL7 register.

17.6 Port F

Port F is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.6.1 Port F configuration

Port F is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port F data register (PDRF)
- Port F direction register (DDRF)

17.6.2 Block diagrams of port F

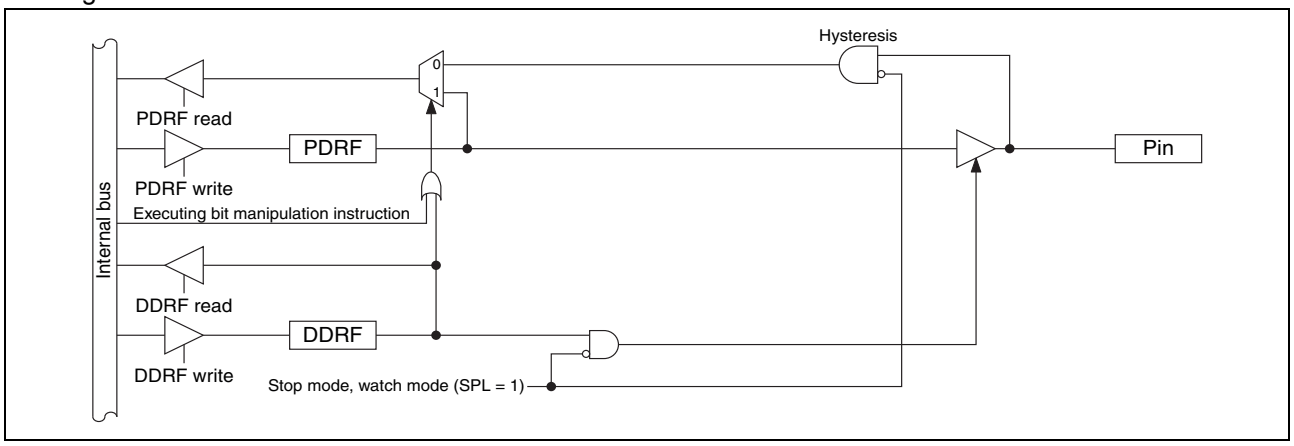
- PF0/X0 pin

  This pin has the following peripheral function:
  - Main clock input oscillation pin (X0)

- PF1/X1 pin

  This pin has the following peripheral function:
  - Main clock I/O oscillation pin (X1)

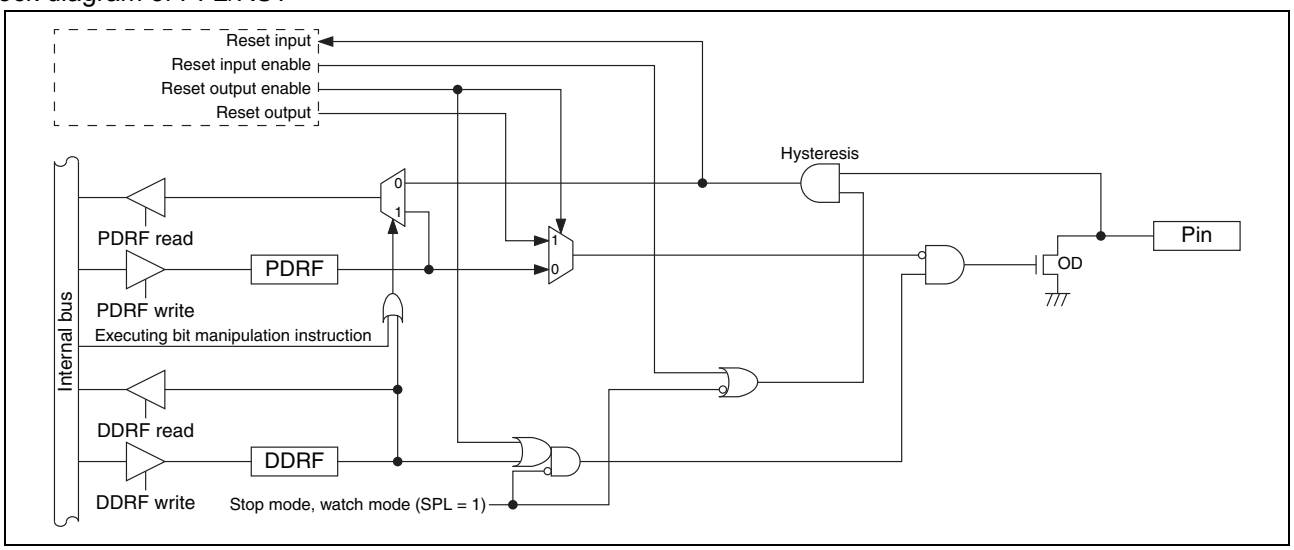
- Block diagram of PF0/X0 and PF1/X1



- PF2/$\overline{\text{RST}}$ pin

  This pin has the following peripheral function:
  - Reset pin ($\overline{\text{RST}}$)

• Block diagram of PF2/$\overline{\text{RST}}$



17.6.3 Port F registers

• Port F register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDRF	0	Pin state is “L” level.	PDRF value is “0”.	As output port, outputs “L” level.
	1	Pin state is “H” level.	PDRF value is “1”.	As output port, outputs “H” level.*
DDRF	0	Port input enabled		
	1	Port output enabled		

*: If the pin is an N-ch open drain pin, the pin state becomes Hi-Z.

• Correspondence between registers and pins for port F

	Correspondence between related register bits and pins							
Pin name	**-**	**-**	**-**	**-**	**-**	**PF2**	**PF1**	**PF0**
PDRF	-	-	-	-	-	bit2*	bit1	bit0
DDRF								

*: When the external reset is selected (SYSC:RSTEN = 1), the port function cannot be used.

17.6.4 Port F operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDRF register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDRF register to external pins.
  - If data is written to the PDRF register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDRF register returns the PDRF register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDRF register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - If data is written to the PDRF register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDRF register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDRF register, the PDRF register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDRF register are initialized to “0” and port input is enabled.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDRF register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

17.7 Port G

Port G is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in “New 8FX MB95690K Series Hardware Manual”.

17.7.1 Port G configuration

Port G is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port G data register (PDRG)
- Port G direction register (DDRG)
- Port G pull-up register (PULG)

17.7.2 Block diagram of port G

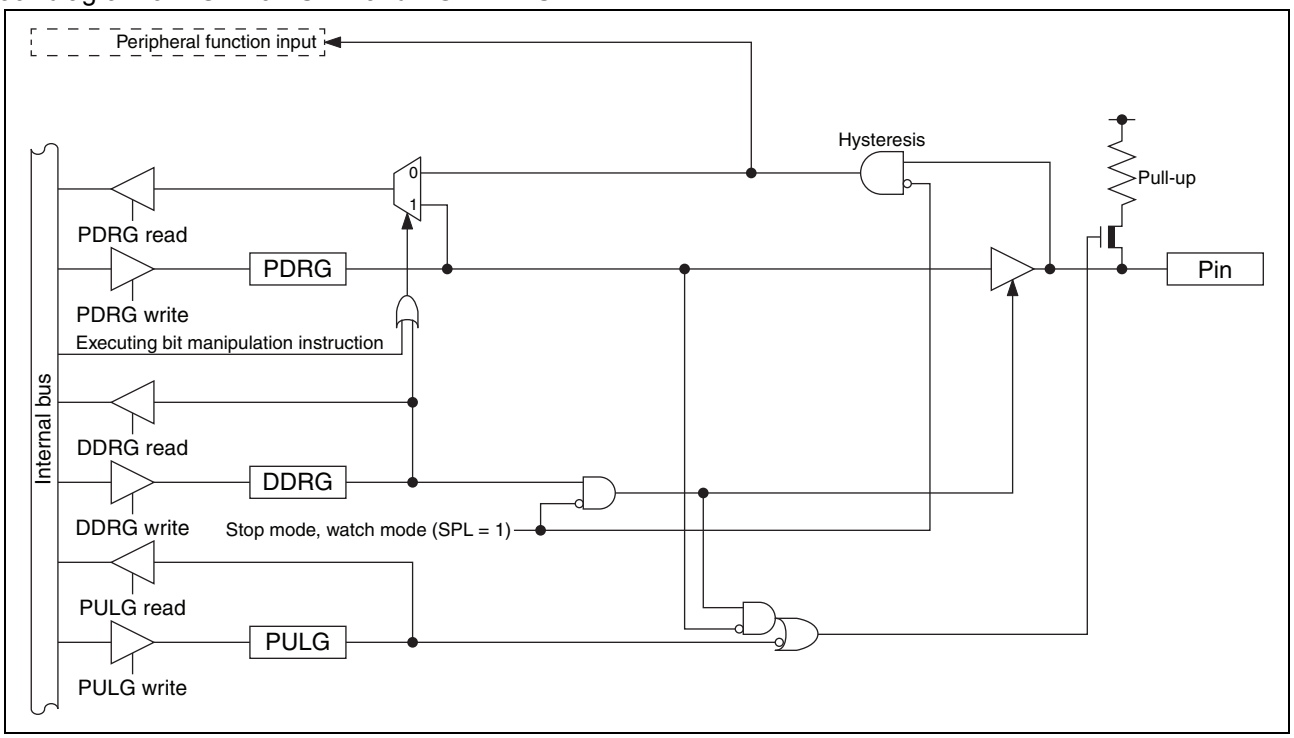
- PG1/X0A/SNI1 pin

  This pin has the following peripheral functions:
  - Subclock input oscillation pin (X0A)
  - Trigger input pin for the position detection function of the MPG waveform sequencer (SNI1)

- PG2/X1A/SNI2 pin

  This pin has the following peripheral functions:
  - Subclock I/O oscillation pin (X1A)
  - Trigger input pin for the position detection function of the MPG waveform sequencer (SNI2)

- Block diagram of PG1/X0A/SNI1 and PG2/X1A/SNI2



17.7.3 Port G registers

- Port G register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDRG	0	Pin state is “L” level.	PDRG value is “0”.	As output port, outputs “L” level.
	1	Pin state is “H” level.	PDRG value is “1”.	As output port, outputs “H” level.
DDRG	0	Port input enabled		
	1	Port output enabled		
PULG	0	Pull-up disabled		
	1	Pull-up enabled		

- Correspondence between registers and pins for port G

	Correspondence between related register bits and pins							
Pin name	**-**	**-**	**-**	**-**	**-**	**PG2**	**PG1**	**-**
PDRG	-	-	-	-	-	bit2	bit1	-
DDRG								
PULG								

17.7.4 Port G operations

- Operation as an output port
  - A pin becomes an output port if the bit in the DDRG register corresponding to that pin is set to “1”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - When a pin is used as an output port, it outputs the value of the PDRG register to external pins.
  - If data is written to the PDRG register, the value is stored in the output latch and is output to the pin set as an output port as it is.
  - Reading the PDRG register returns the PDRG register value.

- Operation as an input port
  - A pin becomes an input port if the bit in the DDRG register corresponding to that pin is set to “0”.
  - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
  - If data is written to the PDRG register, the value is stored in the output latch but is not output to the pin set as an input port.
  - Reading the PDRG register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDRG register, the PDRG register value is returned.

- Operation as a peripheral function input pin
  - To set a pin as an input port, set the bit in the DDRG register corresponding to the input pin of a peripheral function to “0”.
  - Reading the PDRG register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDRG register, the PDRG register value is returned.

- Operation at reset
  If the CPU is reset, all bits in the DDRG register are initialized to “0” and port input is enabled.

- Operation in stop mode and watch mode
  - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDRG register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
  - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

- Operation of the pull-up register
  Setting the bit in the PULG register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PULG register.

18. Interrupt Source Table

Interrupt source	Interrupt request number	Vector table address		Interrupt level setting register		Priority order of interrupt sources of the same level (occurring simultaneously)
		Upper	Lower	Register	Bit	
External interrupt ch. 0	IRQ00	0xFFFA	0xFFFB	ILR0	L00 [1:0]	High

SPL: Pin state setting bit in the standby control register (STBC:SPL)
Hi-Z: High impedance
*1: The pin stays at the state shown when configured as a general-purpose I/O port.
*2: “Input blocked” means direct input gate operation from the pin is disabled.
*3: “Input enabled” means that the input function is enabled. While the input function is enabled, execute a pull-up or pull-down operation in order to prevent leaks due to external input. If a pin is used as an output port, its pin state is the same as that of other ports.
*4: The PF2/$\overline{\text{RST}}$ pin stays at the state shown when configured as a reset pin.
*5: The pull-up control setting is still effective.
*6: Though input is blocked, an external interrupt can be input when the external interrupt request is enabled, and an analog signal can also be input to generate a comparator interrupt when the comparator interrupt is enabled.
*7: Though input is blocked, an external interrupt can be input when the external interrupt request is enabled.
*8: The output function of the comparator is still in operation in stop mode and watch mode.
*9: The I^2C bus interface can wake up the MCU in stop mode or watch mode when its MCU standby mode wakeup function is enabled. For details of the MCU standby mode wakeup function, refer to “New 8FX MB95690K Series Hardware Manual”.

20. Electrical Characteristics

20.1 Absolute Maximum Ratings

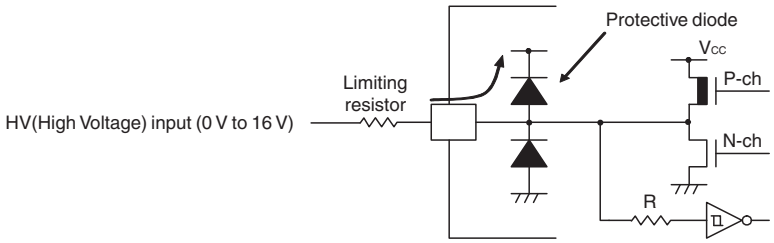
Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	V_{SS} – 0.3	V_{SS} + 6	V	
Input voltage*1	V_I	V_{SS} – 0.3	V_{SS} + 6	V	*2
Output voltage*1	V_O	V_{SS} – 0.3	V_{SS} + 6	V	*2
Maximum clamp current	I_{CLAMP}	–2	+2	mA	Applicable to specific pins*3
Total maximum clamp current	$\Sigma\lvert I_{CLAMP}\rvert$	—	20	mA	Applicable to specific pins*3
“L” level maximum output current	I_{OL}	—	15	mA	
“L” level average current	I_{OLAV1}	—	4	mA	Other than P60 to P67 Average output current = operating current × operating ratio (1 pin)
	I_{OLAV2}		12		P60 to P67 Average output current = operating current × operating ratio (1 pin)
“L” level total maximum output current	ΣI_{OL}	—	100	mA	
“L” level total average output current	ΣI_{OLAV}	—	37	mA	Total average output current = operating current × operating ratio (Total number of pins)
“H” level maximum output current	I_{OH}	—	–15	mA	
“H” level average current	I_{OHAV1}	—	–4	mA	Other than P60 to P67 Average output current = operating current × operating ratio (1 pin)
	I_{OHAV2}		–8		P60 to P67 Average output current = operating current × operating ratio (1 pin)
“H” level total maximum output current	ΣI_{OH}	—	–100	mA	
“H” level total average output current	ΣI_{OHAV}	—	–47	mA	Total average output current = operating current × operating ratio (Total number of pins)
Power consumption	P_d	—	320	mW	
Operating temperature	T_A	–40	+85	°C	
Storage temperature	T_{stg}	–55	+150	°C	

*1: These parameters are based on the condition that V_{SS} is 0.0 V.

*2: V_I and V_O must not exceed V_{CC} + 0.3 V. V_I must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the I_{CLAMP} rating is used instead of the V_I rating.

*3: Specific pins: P00 to P07, P10, P11, P13 to P17, P40 to P47, P60 to P67, P70, P71, P74 to P77, PF0, PF1, PG1, PG2

- Use under recommended operating conditions.
- Use with DC voltage (current).
- The HV (High Voltage) signal is an input signal exceeding the V_{CC} voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
- The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current or stationary current.
- When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the V_{CC} pin, affecting other devices.
- If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
- If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
- Do not leave the HV (High Voltage) input pin unconnected.
- Example of a recommended circuit:
  - Input/Output equivalent circuit



WARNING: Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

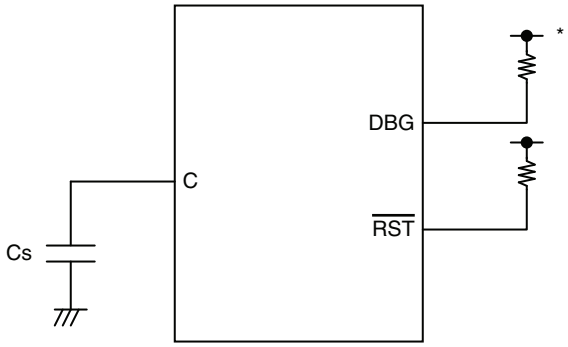
20.2 Recommended Operating Conditions

(V_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC}	2.88	5.5	V	
Decoupling capacitor	C_S	0.022	1	µF	*
Operating temperature	T_A	–40	+85	°C	Other than on-chip debug mode
		+5	+35		On-chip debug mode

*: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_S. For the connection to a decoupling capacitor C_S, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

- DBG / $\overline{\text{RST}}$ / C pins connection diagram



*: Connect the DBG pin to an external pull-up resistor of 2 kΩ or above. After power-on, ensure that the DBG pin does not stay at “L” level until the reset output is released. The DBG pin becomes a communication pin in debug mode. Since the actual pull-up resistance depends on the tool used and the interconnection length, refer to the tool document when selecting a pull-up resistor.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.

Any use of semiconductor devices will be under their recommended operating condition.
Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.

No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

20.3 DC Characteristics

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
"H" level input voltage	V_{IHI}	P47, P72, P73, P77	—	0.7 V_{CC}	—	V_{CC} + 0.3	V	CMOS input level
	V_{IHS}	Other than P47, P72, P73, P77, PF2	—	0.8 V_{CC}	—	V_{CC} + 0.3	V	Hysteresis input
	V_{IHM}	PF2	—	0.8 V_{CC}	—	V_{CC} + 0.3	V	Hysteresis input
"L" level input voltage	V_{ILI}	P47, P72, P73, P77	—	V_{SS} – 0.3	—	0.3 V_{CC}	V	CMOS input level
	V_{ILS}	Other than P47, P72, P73, P77, PF2	—	V_{SS} – 0.3	—	0.2 V_{CC}	V	Hysteresis input
	V_{ILM}	PF2	—	V_{SS} – 0.3	—	0.2 V_{CC}	V	Hysteresis input
Open-drain output application voltage	V_D	P12, P72, P73, PF2	—	V_{SS} – 0.3	—	V_{SS} + 5.5	V	
"H" level output voltage	V_{OH1}	Output pins other than P12, P60 to P67, PF2	I_{OH} = –4 mA	V_{CC} – 0.5	—	—	V	
	V_{OH2}	P60 to P67	I_{OH} = –8 mA	V_{CC} – 0.5	—	—	V	
"L" level output voltage	V_{OL1}	Output pins other than P60 to P67	I_{OL} = 4 mA	—	—	0.4	V	
	V_{OL2}	P60 to P67	I_{OL} = 12 mA	—	—	0.4	V	
Input leak current (Hi-Z output leak current)	I_{LI}	All input pins	0.0 V < V_I < V_{CC}	–5	—	+5	µA	When the internal pull-up resistor is disabled
Internal pull-up resistor	R_{PULL}	Other than P12, P72, P73, PF0, PF1, PF2	V_I = 0 V	25	50	100	kΩ	When the internal pull-up resistor is enabled
Input capacitance	C_{IN}	Other than V_{CC} and V_{SS}	f = 1 MHz	—	5	15	pF	

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ*1	Max*2		
Power supply current*3	I_{CC}	V_{CC} (External clock operation)	F_{CH} = 32 MHz F_{MP} = 16 MHz Main clock mode (divided by 2)	—	4.9	5.8	mA	Except during Flash memory programming and erasing
				—	10.5	13.8	mA	During Flash memory programming and erasing
				—	6.5	9.1	mA	At A/D conversion
	I_{CCS}		F_{CH} = 32 MHz F_{MP} = 16 MHz Main sleep mode (divided by 2)	—	2	3	mA	
	I_{CCL}		F_{CL} = 32 kHz F_{MPL} = 16 kHz Subclock mode (divided by 2) T_A = +25 °C	—	75.9	145	µA	
	I_{CCLS}		F_{CL} = 32 kHz F_{MPL} = 16 kHz Subsleep mode (divided by 2) T_A = +25 °C	—	12.7	16	µA	In deep standby mode
	I_{CCT}		F_{CL} = 32 kHz Watch mode Main stop mode T_A = +25 °C	—	11	13	µA	In deep standby mode
	I_{CCMPLL}	V_{CC}	F_{MCRPLL} = 16 MHz F_{MP} = 16 MHz Main CR PLL clock mode (multiplied by 4) T_A = +25 °C	—	5.2	6.8	mA	
	I_{CCMCR}		F_{CRH} = 4 MHz F_{MP} = 4 MHz Main CR clock mode	—	1.4	4.6	mA	
	I_{CCSCR}		Sub-CR clock mode (divided by 2) T_A = +25 °C	—	76.9	230	µA	
	I_{CCTS}	V_{CC} (External clock operation)	F_{CH} = 32 MHz Time-base timer mode T_A = +25 °C	—	387	455	µA	In deep standby mode
	I_{CCH}		Substop mode T_A = +25 °C	—	10.8	13	µA	In deep standby mode

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ*1	Max*2		
Power supply current*3	I_V	V_{CC}	Current consumption of the comparator	—	60	160	µA	
	I_{LVD}		Current consumption of the low-voltage detection reset circuit	—	4	7	µA	With the LVD reset already enabled by the LVD reset circuit control register (LVDCC)
	I_{CRH}		Current consumption of the main CR oscillator	—	240	320	µA	
	I_{CRL}		Current consumption of the sub-CR oscillator oscillating at 100 kHz	—	7	20	µA	
	I_{NSTBY}		Current consumption difference between normal standby mode and deep standby mode T_A = +25 °C	—	18	30	µA	

*1: V_{CC} = 5.0 V, T_A = +25 °C

*2: V_{CC} = 5.5 V, T_A = +85 °C (unless otherwise specified)

*3:
- The power supply current is determined by the external clock. When the low-voltage detection reset circuit is selected, the power supply current is the sum of adding the current consumption of the low-voltage detection reset circuit (I_{LVD}) to one of the values from I_{CC} to I_{CCH}. In addition, when both the low-voltage detection option and a CR oscillator are selected, the power supply current is the sum of adding up the current consumption of the low-voltage detection reset circuit (I_{LVD}), the current consumption of the CR oscillators (I_{CRH} or I_{CRL}) and one of the values from I_{CC} to I_{CCH}. In on-chip debug mode, the main CR oscillator (I_{CRH}) and the low-voltage detection reset circuit are always in operation, and current consumption therefore increases accordingly.
- See “4. AC Characteristics Clock Timing” for F_{CH}, F_{CL}, F_{CRH} and F_{MCRPLL}.
- See “4. AC Characteristics Source Clock/Machine Clock” for F_{MP} and F_{MPL}.
- The power supply current value in standby mode is measured in deep standby mode. The current consumption in normal standby mode is higher than that in deep standby mode. The power supply current value in normal standby mode can be found by adding the current consumption difference between normal standby mode and deep standby mode (I_{NSTBY}) to the power supply current value in deep standby mode. For details of normal standby mode and deep standby mode, refer to “CHAPTER 3 CLOCK CONTROLLER” in “New 8FX MB95690K Series Hardware Manual”.

20.4 AC Characteristics

20.4.1 Clock Timing

(V_{CC} = 2.88 V to 5.5 V, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
Clock frequency	F_{CH}	X0, X1	—	1	—	16.25	MHz	When the main oscillation circuit is used
		X0	X1: open	1	—	12	MHz	When the main external clock is used
		X0, X1	*	1	—	32.5	MHz	
	F_{CRH}	—	—	3.92	4	4.08	MHz	Operating conditions • The main CR clock is used. • 0 °C ≤ T_A ≤ +70 °C
				3.8	4	4.2	MHz	Operating conditions • The main CR clock is used. • – 40 °C ≤ T_A < 0 °C, + 70 °C < T_A ≤ + 85 °C
	F_{MCRPLL}	—	—	7.84	8	8.16	MHz	Operating conditions • PLL multiplication rate: 2 • 0 °C ≤ T_A ≤ +70 °C
				7.6	8	8.4	MHz	Operating conditions • PLL multiplication rate: 2 • – 40 °C ≤ T_A < 0 °C, + 70 °C < T_A ≤ + 85 °C
				9.8	10	10.2	MHz	Operating conditions • PLL multiplication rate: 2.5 • 0 °C ≤ T_A ≤ +70 °C
				9.5	10	10.5	MHz	Operating conditions • PLL multiplication rate: 2.5 • – 40 °C ≤ T_A < 0 °C, + 70 °C < T_A ≤ + 85 °C
				11.76	12	12.24	MHz	Operating conditions • PLL multiplication rate: 3 • 0 °C ≤ T_A ≤ +70 °C
				11.4	12	12.6	MHz	Operating conditions • PLL multiplication rate: 3 • – 40 °C ≤ T_A < 0 °C, + 70 °C < T_A ≤ + 85 °C
				15.68	16	16.32	MHz	Operating conditions • PLL multiplication rate: 4 • 0 °C ≤ T_A ≤ +70 °C
				15.2	16	16.8	MHz	Operating conditions • PLL multiplication rate: 4 • – 40 °C ≤ T_A < 0 °C, + 70 °C < T_A ≤ + 85 °C
	F_{CL}	X0A, X1A	—	—	32.768	—	kHz	When the sub-oscillation circuit is used
				—	32.768	—	kHz	When the sub-external clock is used
	F_{CRL}	—	—	50	100	150	kHz	When the sub-CR clock is used

(V_{CC} = 2.88 V to 5.5 V, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
Clock cycle time	t_{HCYL}	X0, X1	—	61.5	—	1000	ns	When the main oscillation circuit is used
		X0	X1: open	83.4	—	1000	ns	When an external clock is used
		X0, X1	*	30.8	—	1000	ns	
	t_{LCYL}	X0A, X1A	—	—	30.5	—	µs	When the subclock is used
Input clock pulse width	t_{WH1}, t_{WL1}	X0	X1: open	33.4	—	—	ns	When an external clock is used, the duty ratio should range between 40% and 60%.
		X0, X1	*	12.4	—	—	ns	
	t_{WH2}, t_{WL2}	X0A	—	—	15.2	—	µs	
Input clock rising time and falling time	t_{CR}, t_{CF}	X0, X0A	X1: open	—	—	5	ns	When an external clock is used
		X0, X1, X0A, X1A	*	—	—	5	ns	
CR oscillation start time	t_{CRHWK}	—	—	—	—	50	µs	When the main CR clock is used
	t_{CRLWK}	—	—	—	—	30	µs	When the sub-CR clock is used
PLL oscillation start time	$t_{MCRPLLWK}$	—	—	—	—	100	µs	When the main CR PLL clock is used

*: The external clock signal is input to X0 and the inverted external clock signal to X1.

			—	50	—	kHz	When the sub-CR clock is used F_{CRL} = 100 kHz, divided by 2
Machine clock cycle time*2 (minimum instruction execution time)	t_{MCLK}	—	61.5	—	32000	ns	When the main oscillation clock is used Min: F_{SP} = 16.25 MHz, no division Max: F_{SP} = 0.5 MHz, divided by 16
			250	—	4000	ns	When the main CR clock is used Min: F_{SP} = 4 MHz, no division Max: F_{SP} = 4 MHz, divided by 16
			61	—	976.5	µs	When the suboscillation clock is used Min: F_{SPL} = 16.384 kHz, no division Max: F_{SPL} = 16.384 kHz, divided by 16
			20	—	320	µs	When the sub-CR clock is used Min: F_{SPL} = 50 kHz, no division Max: F_{SPL} = 50 kHz, divided by 16
Machine clock frequency	F_{MP}	—	0.031	—	16.25	MHz	When the main oscillation clock is used
			0.25	—	16	MHz	When the main CR clock is used
	F_{MPL}		1.024	—	16.384	kHz	When the suboscillation clock is used
			3.125	—	50	kHz	When the sub-CR clock is used F_{CRL} = 100 kHz

*1: This is the clock before it is divided according to the division ratio set by the machine clock division ratio select bits (SYCC:DIV[1:0]). This source clock is divided to become a machine clock according to the division ratio set by the

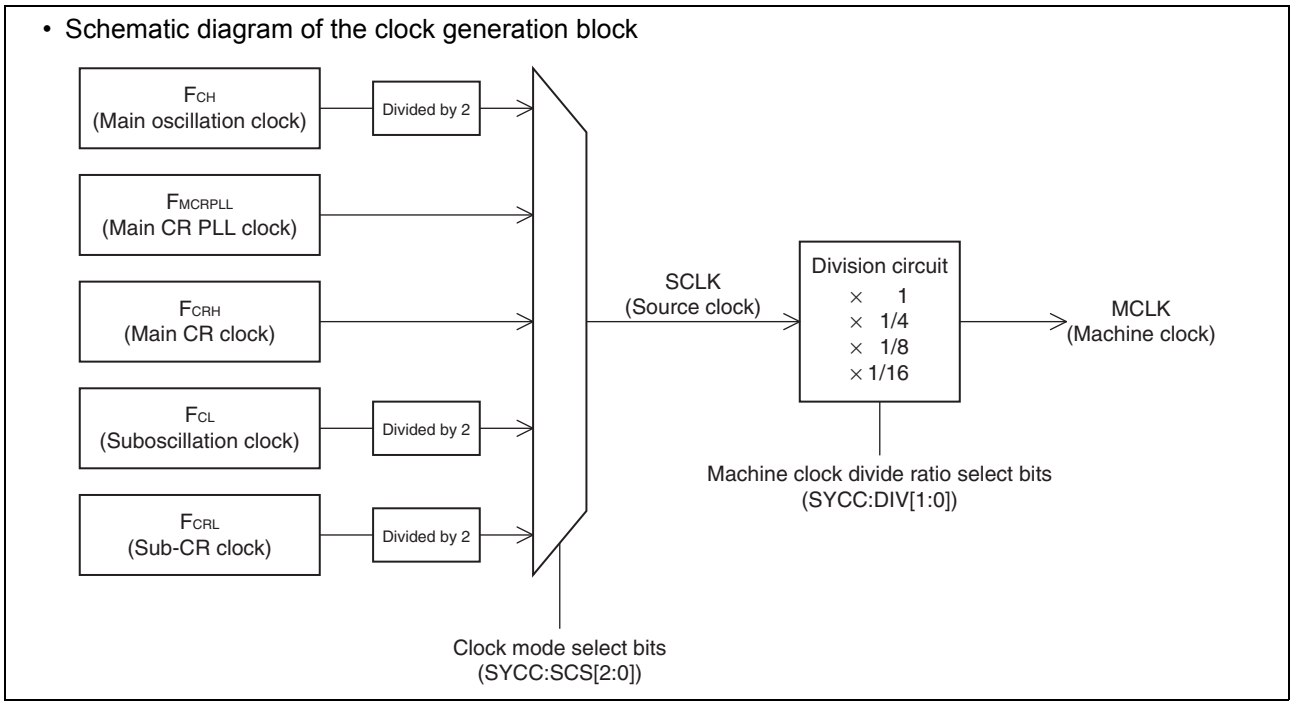
machine clock division ratio select bits (SYCC:DIV[1:0]). In addition, a source clock can be selected from the following.

- Main clock divided by 2
- Main CR clock
- PLL multiplication of main CR clock (Select a multiplication rate from 2, 2.5, 3 and 4.)
- Subclock divided by 2
- Sub-CR clock divided by 2

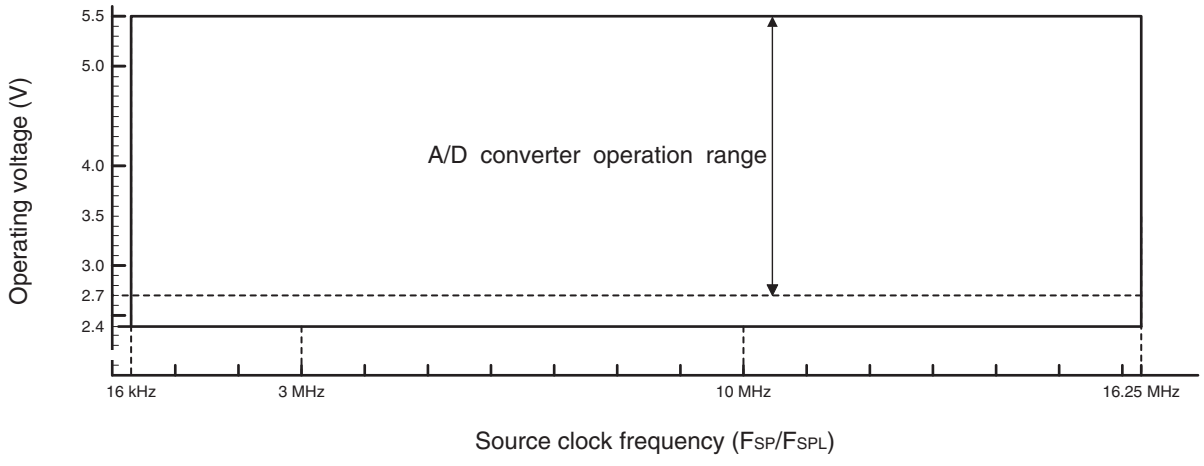
*2: This is the operating clock of the microcontroller. A machine clock can be selected from the following.

- Source clock (no division)
- Source clock divided by 4
- Source clock divided by 8
- Source clock divided by 16

- Schematic diagram of the clock generation block



- Operating voltage - Operating Frequency (T_A = –40 °C to +85 °C)

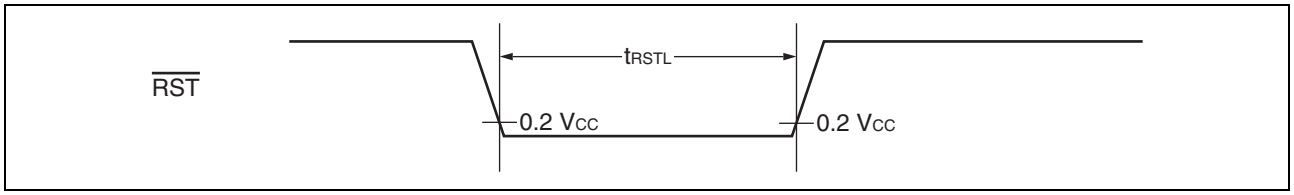


20.4.3 External Reset

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
$\overline{RST}$ "L" level pulse width	t_{RSTL}	2 t_{MCLK}*	—	ns	

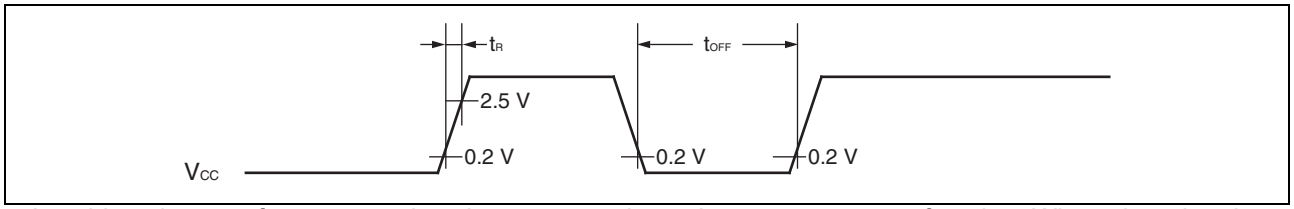
*: See "Source Clock/Machine Clock" for t_{MCLK}.



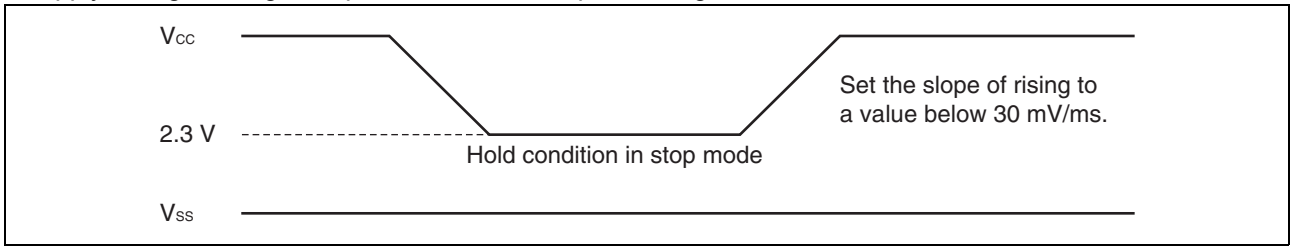
20.4.4 Power-on Reset

(V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Condition	Value		Unit	Remarks
			Min	Max		
Power supply rising time	t_R	—	—	50	ms	
Power supply cutoff time	t_{OFF}	—	1	—	ms	Wait time until power-on



Note: A sudden change of power supply voltage may activate the power-on reset function. When changing the power supply voltage during the operation, set the slope of rising to a value below within 30 mV/ms as shown below.

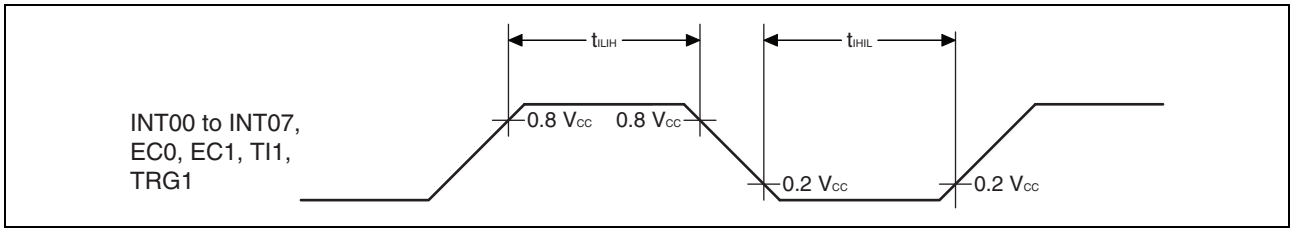


20.4.5 Peripheral Input Timing

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Value		Unit
			Min	Max	
Peripheral input “H” pulse width	t_{ILIH}	INT00 to INT07, EC0, EC1, TI1, TRG1	2 t_{MCLK}*	—	ns
Peripheral input “L” pulse width	t_{IHIL}		2 t_{MCLK}*	—	ns

*: See “Source Clock/Machine Clock” for t_{MCLK}.



20.4.6 LIN-UART Timing

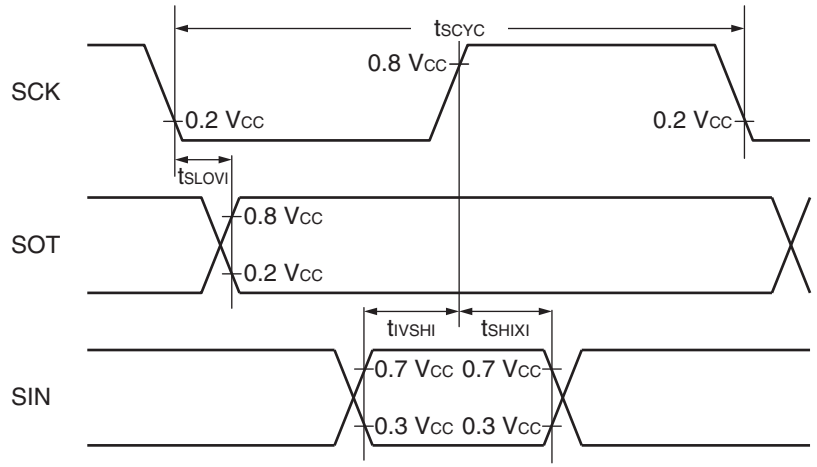
Sampling is executed at the rising edge of the sampling clock*1, and serial clock delay is disabled*2. (ESCR register : SCES bit = 0, ECCR register : SCDE bit = 0)

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

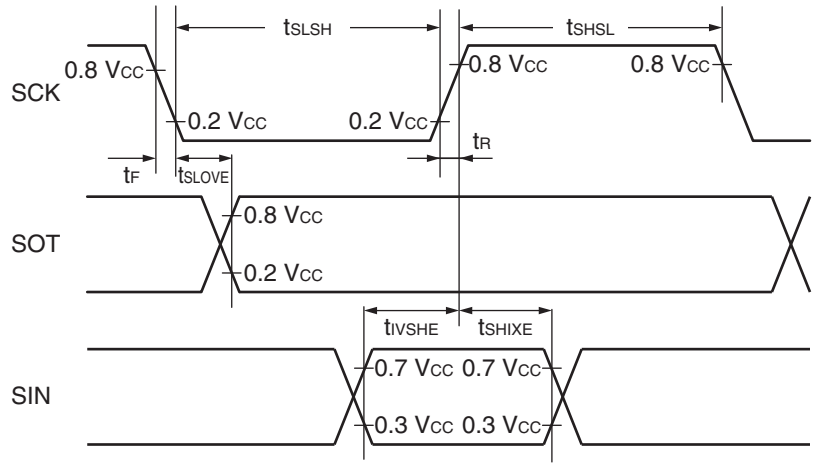
Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
Serial clock cycle time	t_{SCYC}	SCK	Internal clock operation output pin: C_L = 80 pF + 1 TTL	5 t_{MCLK}*3	—	ns
SCK↓ → SOT delay time	t_{SLOVI}	SCK, SOT		–50	+50	ns
Valid SIN → SCK↑	t_{IVSHI}	SCK, SIN		t_{MCLK}*3 + 80	—	ns
SCK↑ → valid SIN hold time	t_{SHIXI}	SCK, SIN		0	—	ns
Serial clock “L” pulse width	t_{SLSH}	SCK	External clock operation output pin: C_L = 80 pF + 1 TTL	3 t_{MCLK}*3–t_R	—	ns
Serial clock “H” pulse width	t_{SHSL}	SCK		t_{MCLK}*3 + 10	—	ns
SCK↓ → SOT delay time	t_{SLOVE}	SCK, SOT		—	2 t_{MCLK}*3 + 60	ns
Valid SIN → SCK↑	t_{IVSHE}	SCK, SIN		30	—	ns
SCK↑ → valid SIN hold time	t_{SHIXE}	SCK, SIN		t_{MCLK}*3 + 30	—	ns
SCK fall time	t_F	SCK		—	10	ns
SCK rise time	t_R	SCK		—	10	ns

*1: There is a function used to choose whether the sampling of reception data is performed at a rising edge or a falling edge of the serial clock.
*2: The serial clock delay function is a function used to delay the output signal of the serial clock for half the clock.
*3: See “Source Clock/Machine Clock” for t_{MCLK}.

- Internal shift clock mode



- External shift clock mode



Sampling is executed at the falling edge of the sampling clock*1, and serial clock delay is disabled*2. (ESCR register : SCES bit = 1, ECCR register : SCDE bit = 0)

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
Serial clock cycle time	t_{SCYC}	SCK	Internal clock operation output pin: C_L = 80 pF + 1 TTL	5 t_{MCLK}*3	—	ns

*2: The serial clock delay function is a function used to delay the output signal of the serial clock for half the clock.
*3: See “Source Clock/Machine Clock” for t_{MCLK}.

20.4.7 Low-voltage Detection

(V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Release voltage*	V_{DL+}	2.52	2.7	2.88	V	At power supply rise
		2.61	2.8	2.99		
		2.89	3.1	3.31		
		3.08	3.3	3.52		
Detection voltage*	V_{DL-}	2.43	2.6	2.77	V	At power supply fall
		2.52	2.7	2.88		
		2.80	3	3.20		
		2.99	3.2	3.41		
Hysteresis width	V_{HYS}	—	—	100	mV	
Power supply start voltage	V_{off}	—	—	2.3	V	
Power supply end voltage	V_{on}	4.9	—	—	V	
Power supply voltage change time (at power supply rise)	t_r	650	—	—	µs	Slope of power supply that the reset release signal generates within the rating (V_{DL+})
Power supply voltage change time (at power supply fall)	t_f	650	—	—	µs	Slope of power supply that the reset release signal generates within the rating (V_{DL-})
Reset release delay time	t_{d1}	—	—	30	µs	
Reset detection delay time	t_{d2}	—	—	30	µs	
LVD reset threshold voltage transition stabilization time	t_{stb}	10	—	—	µs	

*: After the LVD reset is enabled by the LVD reset circuit control register (LVDCC), the release voltage and the detection voltage can be selected by using the LVD reset voltage selection ID register (LVDR) in the low-voltage detection reset circuit. For details of the LVDCC register and the LVDR register, refer to “CHAPTER 16 LOW-VOLTAGE DETECTION RESET CIRCUIT” in “New 8FX MB95690K Series Hardware Manual”.

20.4.8 I²C Bus Interface Timing

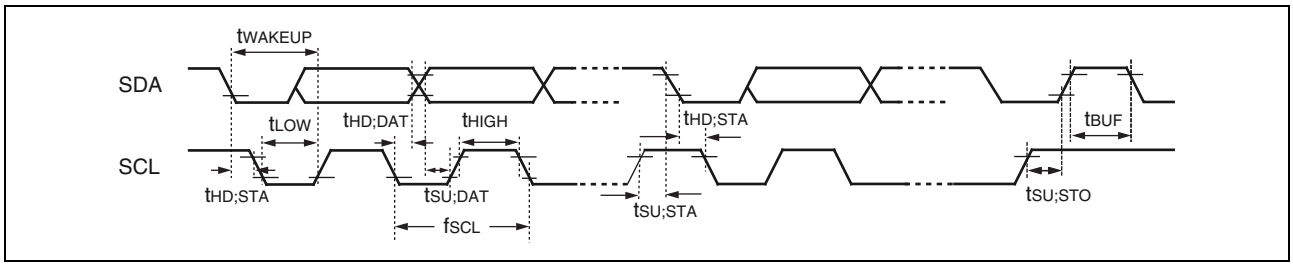
(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value				Unit
				Standard-mode		Fast-mode		
				Min	Max	Min	Max	
SCL clock frequency	f_{SCL}	SCL	R = 1.7 kΩ, C = 50 pF*1	0	100	0	400	kHz
(Repeated) START condition hold time SDA ↓ → SCL ↓	$t_{HD;STA}$	SCL, SDA		4.0	—	0.6	—	µs
SCL clock “L” width	t_{LOW}	SCL		4.7	—	1.3	—	µs
SCL clock “H” width	t_{HIGH}	SCL		4.0	—	0.6	—	µs
(Repeated) START condition setup time SCL ↑ → SDA ↓	$t_{SU;STA}$	SCL, SDA		4.7	—	0.6	—	µs
Data hold time SCL ↓ → SDA ↓↑	$t_{HD;DAT}$	SCL, SDA		0	3.45*2	0	0.9*3	µs
Data setup time SDA ↓↑ → SCL ↑	$t_{SU;DAT}$	SCL, SDA		0.25	—	0.1	—	µs
STOP condition setup time SCL ↑ → SDA ↑	$t_{SU;STO}$	SCL, SDA		4	—	0.6	—	µs
Bus free time between STOP condition and START condition	t_{BUF}	SCL, SDA		4.7	—	1.3	—	µs

*1: R represents the pull-up resistor of the SCL and SDA lines, and C the load capacitor of the SCL and SDA lines.

*2: The maximum $t_{HD;DAT}$ in the Standard-mode is applicable only when the time during which the device is holding the SCL signal at “L” (t_{LOW}) does not extend.

*3: A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, provided that the condition of $t_{SU;DAT}$ ≥ 250 ns is fulfilled.



(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value*2		Unit	Remarks
				Min	Max		
SCL clock “L” width	t_{LOW}	SCL	R = 1.7 kΩ, C = 50 pF*1	(2 + nm/2)t_{MCLK} – 20	—	ns	Master mode
SCL clock “H” width	t_{HIGH}	SCL		(nm/2)t_{MCLK} – 20	(nm/2)t_{MCLK} + 20	ns	Master mode
START condition hold time	$t_{HD;STA}$	SCL, SDA		(-1 + nm/2)t_{MCLK} – 20	(-1 + nm)t_{MCLK} + 20	ns	Master mode Maximum value is applied when m, n = 1, 8. Otherwise, the minimum value is applied.
STOP condition setup time	$t_{SU;STO}$	SCL, SDA		(1 + nm/2)t_{MCLK} – 20	(1 + nm/2)t_{MCLK} + 20	ns	Master mode
START condition setup time	$t_{SU;STA}$	SCL, SDA		(1 + nm/2)t_{MCLK} – 20	(1 + nm/2)t_{MCLK} + 20	ns	Master mode
Bus free time between STOP condition and START condition	t_{BUF}	SCL, SDA		(2 nm + 4) t_{MCLK} – 20	—	ns	
Data hold time	$t_{HD;DAT}$	SCL, SDA		3 t_{MCLK} – 20	—	ns	Master mode
Data setup time	$t_{SU;DAT}$	SCL, SDA		(-2 + nm/2) t_{MCLK} – 20	(-1 + nm/2) t_{MCLK} + 20	ns	Master mode It is assumed that “L” of SCL is not extended. The minimum value is applied to the first bit of continuous data. Otherwise, the maximum value is applied.
Setup time between clearing interrupt and SCL rising	$t_{SU;INT}$	SCL		(nm/2) t_{MCLK} – 20	(1 + nm/2) t_{MCLK} + 20	ns	The minimum value is applied to the interrupt at the ninth SCL↓. The maximum value is applied to the interrupt at the eighth SCL↓.
SCL clock “L” width	t_{LOW}	SCL		4 t_{MCLK} – 20	—	ns	At reception
SCL clock “H” width	t_{HIGH}	SCL		4 t_{MCLK} – 20	—	ns	At reception

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value*2		Unit	Remarks
				Min	Max		
START condition detection	$t_{HD;STA}$	SCL, SDA	R = 1.7 kΩ, C = 50 pF*1	2 t_{MCLK} – 20	—	ns	No START condition is detected when 1 t_{MCLK} is used at reception.
STOP condition detection	$t_{SU;STO}$	SCL, SDA		2 t_{MCLK} – 20	—	ns	No STOP condition is detected when 1 t_{MCLK} is used at reception.
RESTART condition detection condition	$t_{SU;STA}$	SCL, SDA		2 t_{MCLK} – 20	—	ns	No RESTART condition is detected when 1 t_{MCLK} is used at reception.
Bus free time	t_{BUF}	SCL, SDA		2 t_{MCLK} – 20	—	ns	At reception
Data hold time	$t_{HD;DAT}$	SCL, SDA		2 t_{MCLK} – 20	—	ns	At slave transmission mode
Data setup time	$t_{SU;DAT}$	SCL, SDA		t_{LOW} – 3 t_{MCLK} – 20	—	ns	At slave transmission mode
Data hold time	$t_{HD;DAT}$	SCL, SDA		0	—	ns	At reception
Data setup time	$t_{SU;DAT}$	SCL, SDA		t_{MCLK} – 20	—	ns	At reception
SDA↓ → SCL↑ (with wakeup function in use)	t_{WAKEUP}	SCL, SDA		Oscillation stabilization wait time +2 t_{MCLK} – 20	—	ns	

*1: R represents the pull-up resistor of the SCL and SDA lines, and C the load capacitor of the SCL and SDA lines.

*2: • See “Source Clock/Machine Clock” for t_{MCLK}.

- m represents the CS[4:3] bits in the I²C clock control register ch. 0 (ICCR0).
- n represents the CS[2:0] bits in the I²C clock control register ch. 0 (ICCR0).
- The actual timing of the I²C bus interface is determined by the values of m and n set by the machine clock (t_{MCLK}) and the CS[4:0] bits in the ICCR0 register.
- Standard-mode:
  m and n can be set to values in the following range: 0.9 MHz < t_{MCLK} (machine clock) < 16.25 MHz.
  The usable frequencies of the machine clock are determined by the settings of m and n as shown below.
  (m, n) = (1, 8) : 0.9 MHz < t_{MCLK} ≤ 1 MHz
  (m, n) = (1, 22), (5, 4), (6, 4), (7, 4), (8, 4) : 0.9 MHz < t_{MCLK} ≤ 2 MHz
  (m, n) = (1, 38), (5, 8), (6, 8), (7, 8), (8, 8) : 0.9 MHz < t_{MCLK} ≤ 4 MHz
  (m, n) = (1, 98), (5, 22), (6, 22), (7, 22) : 0.9 MHz < t_{MCLK} ≤ 10 MHz
  (m, n) = (8, 22) : 0.9 MHz < t_{MCLK} ≤ 16.25 MHz
- Fast-mode:
  m and n can be set to values in the following range: 3.3 MHz < t_{MCLK} (machine clock) < 16.25 MHz.
  The usable frequencies of the machine clock are determined by the settings of m and n as shown below.
  (m, n) = (1, 8) : 3.3 MHz < t_{MCLK} ≤ 4 MHz
  (m, n) = (1, 22), (5, 4) : 3.3 MHz < t_{MCLK} ≤ 8 MHz
  (m, n) = (1, 38), (6, 4), (7, 4), (8, 4) : 3.3 MHz < t_{MCLK} ≤ 10 MHz
  (m, n) = (5, 8) : 3.3 MHz < t_{MCLK} ≤ 16.25 MHz

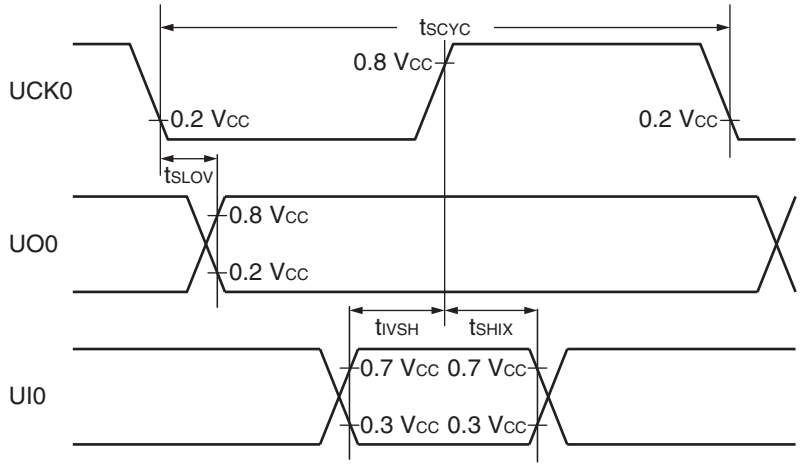
20.4.9 UART/SIO, Serial I/O Timing

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

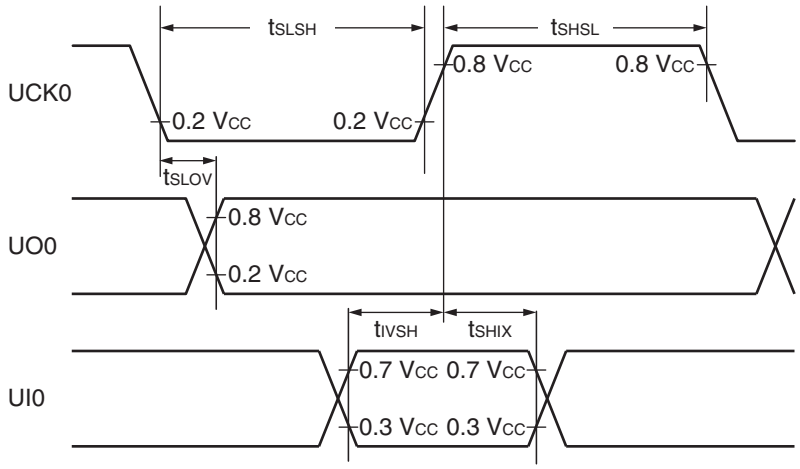
Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
Serial clock cycle time	t_{SCYC}	UCK0	Internal clock operation	4 t_{MCLK}*	—	ns
UCK ↓ → UO time	t_{SLOV}	UCK0, UO0		–190	+190	ns
Valid UI → UCK ↑	t_{IVSH}	UCK0, UI0		2 t_{MCLK}*	—	ns
UCK ↑ → valid UI hold time	t_{SHIX}	UCK0, UI0		2 t_{MCLK}*	—	ns
Serial clock “H” pulse width	t_{SHSL}	UCK0	External clock operation	4 t_{MCLK}*	—	ns
Serial clock “L” pulse width	t_{SLSH}	UCK0		4 t_{MCLK}*	—	ns
UCK ↓ → UO time	t_{SLOV}	UCK0, UO0		—	190	ns
Valid UI → UCK ↑	t_{IVSH}	UCK0, UI0		2 t_{MCLK}*	—	ns
UCK ↑ → valid UI hold time	t_{SHIX}	UCK0, UI0		2 t_{MCLK}*	—	ns

*: See “Source Clock/Machine Clock” for t_{MCLK}.

- Internal shift clock mode



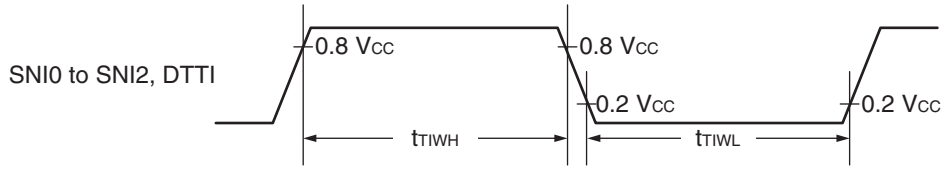
- External shift clock mode



20.4.10 MPG Input Timing

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
Input pulse width	t_{TIWH}, t_{TIWL}	SNI0 to SNI2, DTTI	—	4 t_{MCLK}	—	ns	



20.4.11 Comparator Timing

(V_{CC} = 2.88 V to 5.5 V, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Pin name	Value			Unit	Remarks
		Min	Typ	Max		
Voltage range	CMP0_P, CMP0_N, CMP1_P, CMP1_N	0	—	V_{CC} – 1.3	V	
Offset voltage	CMP0_P, CMP0_N, CMP1_P, CMP1_N	–15	—	+15	mV	
Delay time	CMP0_O, CMP1_O	—	650	1200	ns	Overdrive 5 mV
		—	140	420	ns	Overdrive 50 mV
Power down delay	CMP0_O, CMP1_O	—	—	1200	ns	Power down recovery PD: 1 → 0
Power up stabilization wait time	CMP0_O, CMP1_O	—	—	1200	ns	Output stabilization wait time at power up

20.4.12 BGR for Comparator

(V_{CC} = 2.88 V to 5.5 V, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power up stabilization wait time	—	—	—	150	µs	Load: 10 pF
Output voltage	VBGR	1.1495	1.21	1.2705	V	

20.5 A/D Converter

20.5.1 A/D Converter Electrical Characteristics

(V_{CC} = 2.7 V to 5.5 V, V_{SS} = 0.0 V, T_A = –40 °C to +85 °C)

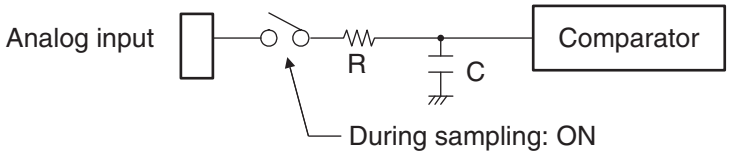
Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Resolution	—	—	—	10	bit	
Total error		–3	—	+3	LSB	
Linearity error		–2.5	—	+2.5	LSB	
Differential linearity error		–1.9	—	+1.9	LSB	
Zero transition voltage	V_{0T}	V_{SS} – 7.2 LSB	V_{SS} + 0.5 LSB	V_{SS} + 8.2 LSB	V	
Full-scale transition voltage	V_{FST}	V_{CC} – 6.2 LSB	V_{CC} – 1.5 LSB	V_{CC} + 9.2 LSB	V	
Compare time	—	3	—	10	µs	2.7 V ≤ V_{CC} ≤ 5.5 V
Sampling time	—	0.941	—	∞	µs	2.7 V ≤ V_{CC} ≤ 5.5 V, with external impedance < 3.3 kΩ and external capacitance = 10 pF
Analog input current	I_{AIN}	–0.3	—	+0.3	µA	
Analog input voltage	V_{AIN}	V_{SS}	—	V_{CC}	V	

20.5.2 Notes on Using A/D Converter

- External impedance of analog input and its sampling time

  The A/D converter of the MB95690K Series has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the capacitor of the internal sample and hold circuit is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 µF to the analog input pin.

- Analog input equivalent circuit

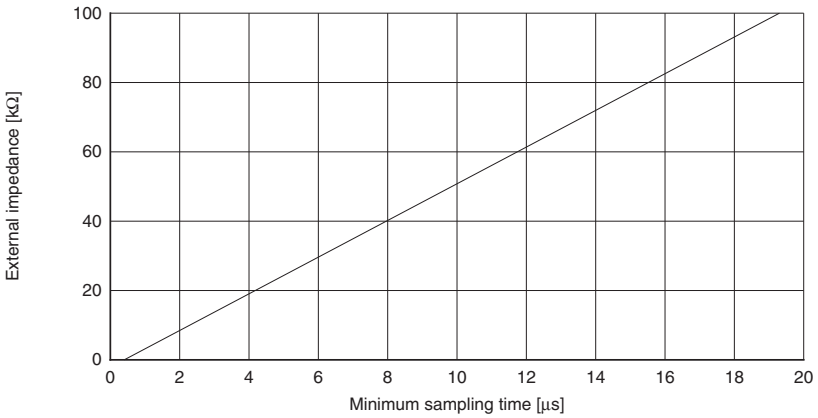


V_{CC}	R	C
4.5 V ≤ V_{CC} ≤ 5.5 V	1.45 kΩ (Max)	14.89 pF (Max)
2.7 V ≤ V_{CC} < 4.5 V	2.7 kΩ (Max)	14.89 pF (Max)

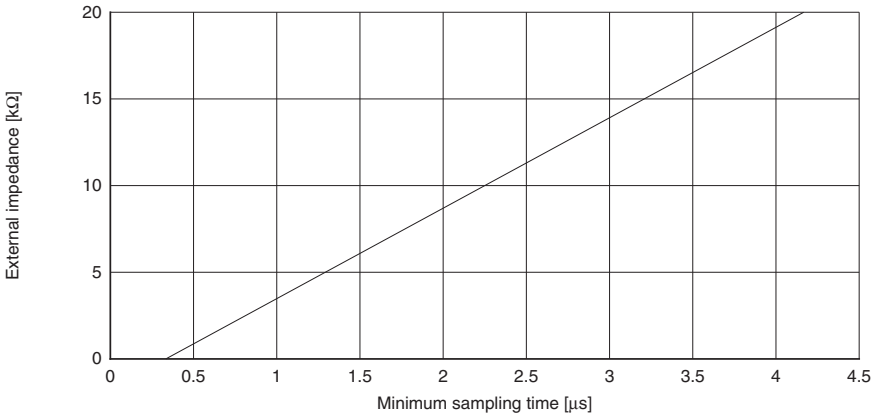
Note: The values are reference values.

- Relationship between external impedance and minimum sampling time

[External impedance = 0 kΩ to 100 kΩ]



[External impedance = 0 kΩ to 20 kΩ]

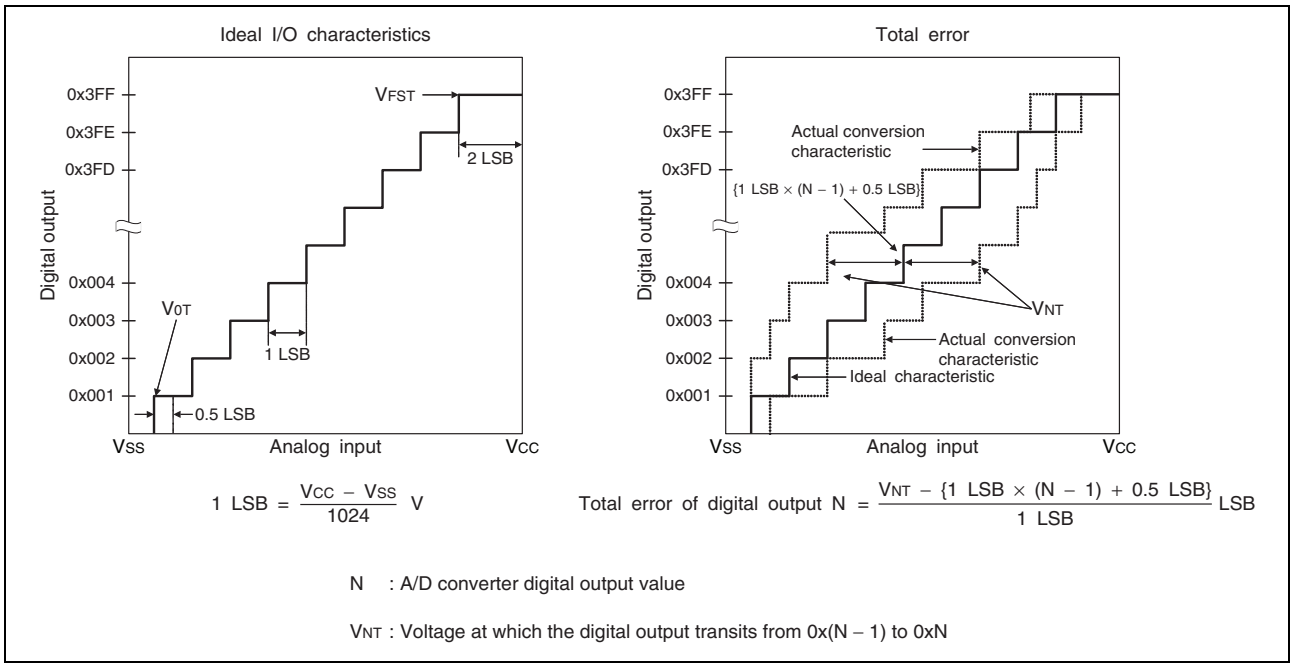


Note: External capacitance = 10 pF

- A/D conversion error
  As |V_{CC} – V_{SS}| decreases, the A/D conversion error increases proportionately.

20.5.3 Definitions of A/D Converter Terms

- Resolution
  It indicates the level of analog variation that can be distinguished by the A/D converter.
  When the number of bits is 10, analog voltage can be divided into 2^{10} = 1024.
- Linearity error (unit: LSB)
  It indicates how much an actual conversion value deviates from the straight line connecting the zero transition point ("0000000000" ← → "0000000001") of a device to the full-scale transition point ("1111111111" ← → "1111111110") of the same device.
- Differential linear error (unit: LSB)
  It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.
- Total error (unit: LSB)
  It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.



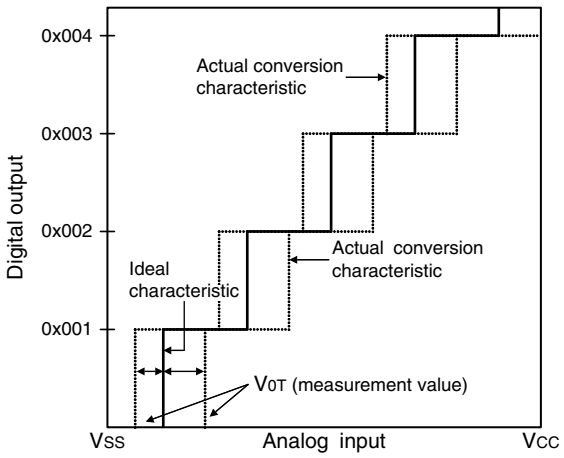
$$1\ \text{LSB} = \frac{V_{CC} - V_{SS}}{1024}\ \text{V}$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}}\ \text{LSB}$$

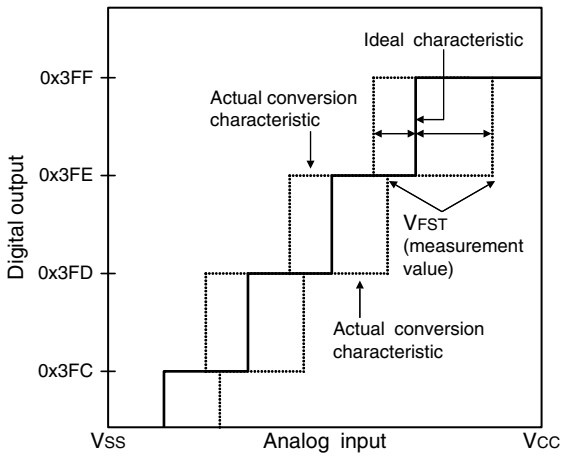
N : A/D converter digital output value

V_{NT} : Voltage at which the digital output transits from 0x(N – 1) to 0xN

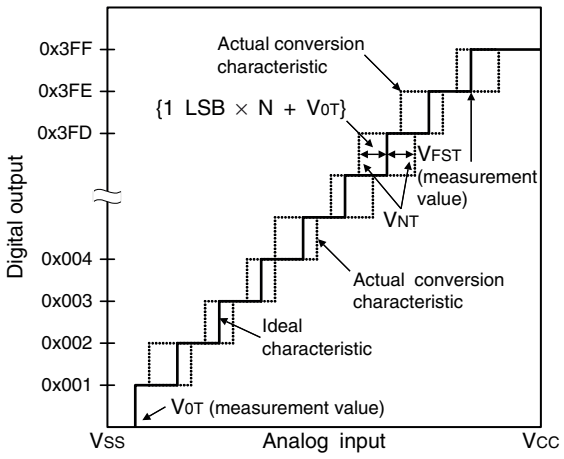
Zero transition error



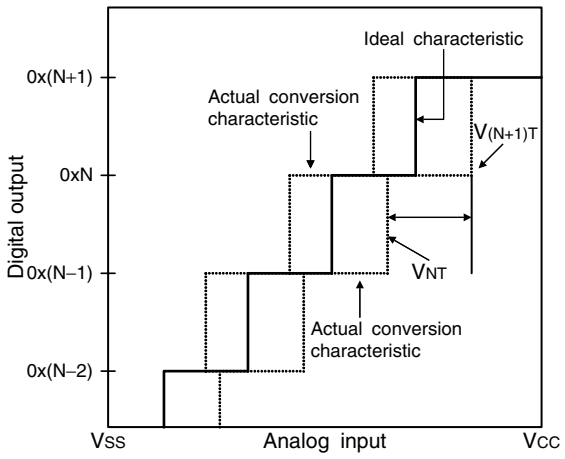
Full-scale transition error



Linearity error



Differential linearity error



$$\text{Linearity error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times N + V_{OT}\}}{1\ \text{LSB}}$$

$$\text{Differential linearity error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\ \text{LSB}} - 1$$

N : A/D converter digital output value

V_{NT} : Voltage at which the digital output transits from 0x(N – 1) to 0xN

V_{OT} (ideal value) = V_{SS} + 0.5 LSB [V]

V_{FST} (ideal value) = V_{CC} – 2 LSB [V]

20.6 Flash Memory Program/Erase Characteristics

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time (2 Kbyte sector)	—	0.3*1	1.6*2	s	The time of writing “0x00” prior to erasure is excluded.
Sector erase time (32 Kbyte sector)	—	0.6*1	3.1*2	s	The time of writing “0x00” prior to erasure is excluded.
Byte writing time	—	17	272	µs	System-level overhead is excluded.
Program/erase cycle	100000	—	—	cycle	
Power supply voltage at program/erase	2.4	—	5.5	V	
Flash memory data retention time	20*3	—	—	year	Average T_A = +85 °C Number of program/erase cycles: 1000 or below
	10*3	—	—		Average T_A = +85 °C Number of program/erase cycles: 1001 to 10000 inclusive
	5*3	—	—		Average T_A = +85 °C Number of program/erase cycles: 10001 or above

*1: V_{CC} = 5.5 V, T_A = +25 °C, 0 cycle
*2: V_{CC} = 2.4 V, T_A = +85 °C, 100000 cycles
*3: These values were converted from the result of a technology reliability assessment. (These values were converted from the result of a high temperature accelerated test using the Arrhenius equation with the average temperature being +85 °C.)

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
3. DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
4. TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.
11. JEDEC SPECIFICATION NO. REF: N/A.

6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

002-13731 **

PACKAGE OUTLINE, 48 LEAD LQFP

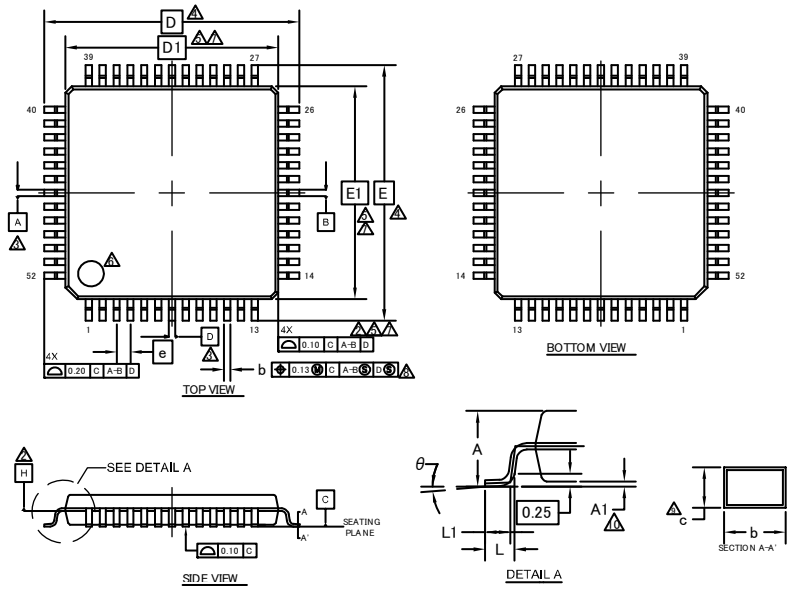
Package Type	Package Code
LQFP 52	LQC052



SYMBOL	DIMENSION		
	MIN.	NOM.	MAX.
A	—	—	1.70
A1	0.00	—	0.20
b	0.265	0.30	0.365
c	0.09	—	0.20
D	12.00 BSC		
D1	10.00 BSC		
e	0.65 BSC		
E	12.00 BSC		
E1	10.00 BSC		
L	0.45	0.60	0.75
L1	0.30	0.50	0.70
θ	0°	—	8°

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
3. DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
4. TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

NOTE

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCIN C CONFORMS TO ASME Y14.5–1994.
3. N IS THE TOTAL NU MBER OF TERMINALS.
4. DIMENSION "b" APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30mm FROM TERMINAL TIP.IF THE TERMINAL HAS THE OPTIONAL RADIUS ON THE OTHER END OF THE TERMINAL. THE DIMENSION "b"SHO ULD NOT BE MEASURED IN THAT RADIUS AREA.
5. ND REFER TO THE NUMBER OF TERMINALS ON D OR E SIDE.
6. MAX. PACKAGE W ARPAGE IS 0.05mm.
7. MAXIMUM ALLOW ABLE BURRS IS 0.076mm IN ALL DIRECTIONS.
8. PIN #1 ID ON TOP W ILL BE LOCATED W ITHIN INDICATED ZONE.
9. BILATERAL COPLANARITY ZONE APPLIES TO THE EXPOSED HEAT SINK SLUG AS W ELL AS THE TERMINALS.
10. JEDEC SPECIFICATION NO. REF : N/A

24. Major Changes In This Edition

Spansion Publication Number: DS702-00014-2v0-E

Page	Section	Details
2	■ FEATURES	Added information on FPT-44P-M25.
4	■ PRODUCT LINE-UP	Added information on FPT-44P-M25 to the parameters “General-purpose I/O” and “8/10-bit A/D converter”.
5		Added information on FPT-44P-M25 to the parameter “External interrupt”.
6		Added FPT-44P-M25 to the parameter “Package”.
7	■ PACKAGES AND CORRESPONDING PRODUCTS	Added information on FPT-44P-M25.
9	■ PIN ASSIGNMENT	Added the pin assignment diagram of FPT-44P-M25.
13 to 16	■ PIN FUNCTIONS (FPT-44P-M25)	New section
17	■ PIN FUNCTIONS (FPT-48P-M49, FPT-52P-M02, LCC-48P-M11)	Renamed the section “■ PIN FUNCTIONS” to “■ PIN FUNCTIONS (FPT-48P-M49, FPT-52P-M02, LCC-48P-M11).
29	■ PIN CONNECTION • DBG pin	Revised details of “• DBG pin”.
	• $\overline{\text{RST}}$ pin	Revised details of “• $\overline{\text{RST}}$ pin”.
30	• C pin	Corrected the following statement. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S. → The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_S.
31	■ BLOCK DIAGRAM (FPT-44P-M25)	New section
32	■ BLOCK DIAGRAM (FPT-48P-M49, FPT-52P-M02, LCC-48P-M11)	Renamed the section “■ BLOCK DIAGRAM” to “■ BLOCK DIAGRAM (FPT-48P-M49, FPT-52P-M02, LCC-48P-M11).
75	■ I/O PORTS 6. Port F (4) Port F operations • Operation as an input port	Added the following statement. For a pin shared with other peripheral functions, disable the output of such peripheral functions.
78	7. Port G (4) Port G operations • Operation as an input port	Added the following statement. For a pin shared with other peripheral functions, disable the output of such peripheral functions.

Page	Section	Details
85	■ ELECTRICAL CHARACTERISTICS 2. Recommended Operating Conditions	Corrected the following statement in the remark of the parameter “Decoupling capacitor”. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S. → The decoupling capacitor for the V_{CC} pin must have a capacitance equal to or larger than the capacitance of C_S.
		Revised the remark in “• DBG/$\overline{RST}$/C pins connection diagram”.
86	3. DC Characteristics	Revised the remark of the parameter “Input leak current (Hi-Z output leak current)”. When pull-up resistance is disabled → When the internal pull-up resistor is disabled
		Renamed the parameter “Pull-up resistance” to “Internal pull-up resistor”.
		Revised the remark of the parameter “Internal pull-up resistor”. When pull-up resistance is enabled → When the internal pull-up resistor is enabled
90	4. AC Characteristics (1) Clock Timing	Corrected the pin names of the parameter “Input clock rising time and falling time”. X0 → X0, X0A X0, X1 → X0, X1, X0A, X1A
125	■ ORDERING INFORMATION	Added the part numbers of FPT-44P-M25.
126	■ PACKAGE DIMENSION	Added the package diagram of FPT-44P-M25.

NOTE: Please see “Document History” about later revised information.

Document History Page

Document Title: MB95690K Series, New 8FX 8-bit Microcontrollers Document Number: 002-04692				
Revision	**ECN**	**Orig. of Change**	**Submission Date**	**Description of Change**
**	-	AKIH	06/17/2013	Migrated to Cypress and assigned document number 002-08453. No change to document contents or format.
*A	5193921	AKIH	03/29/2016	Updated to Cypress template Added MB95F698KPMC2-G-UNE2, MB95F698KPMC1-G-UNE2 in "Ordering Information".
*B	5421818	YUTT	09/01/2016	Changed package code as the following in 1.Product Line-up (Page4 to 6), 2.Packages And Corresponding Products (Page 7), 4.Pin Assignment (Page 9 to 10), 6.Pin Functions (Page16, 20), 12.Block Diagram(Page30), 27.Ordering Information (Page 121) and 28.Package Dimensions (Page 77 to 83). "FPT-48P-M49" to "LQA048-02" and "FPT-52P-M02" to "LQC052" Added Part number "MB95F698KPMC-G-UNE2" in 22.Ordering Information (Page 121).
*C	5633433	HTER	02/17/2017	Changed the package codes as the following from "FPT-44P-M25" to "LQF044" from "LQA048-02" to "LQA048" from "LCC-48P-M11" to "WNR048" in chapter: Features (Page 1) 1.Product Line-up (Page 4 to 6) 2.Packages And Corresponding Products (Page 6) 4.Pin Assignment (Page 8 to 11) 5.Pin Functions (Page 12) 6.Pin Functions (Page 16, 20) 11.Block Diagram (Page 29) 12.Block Diagram (Page 30) 22.Ordering Information (Page 121) 23.Package Dimensions (Page 122 to 125). Deleted the Part numbers - MB95F698KPMC2-G-SNE2 - MB95F698KPMC-G-SNE2 - MB95F698KPMC1-G-SNE2 in chapter 22.Ordering Information (Page 121).
*D	5725083	AESATMP8	05/16/2017	Updated logo and Copyright
*E	5896506	HUAL	09/27/2017	Added Packing information Modified from "MB95F694KPMC-G-SNE2" to "MB95F694KPMC-G-UNE2" in 22.Ordering Information (Page 121)
