DESCRIPTION

The APE8988B is a low R_{ON} load switch with controlled turn on. It contains one N-channel MOSFET that can operate over an input voltage range of 0.8V to 5.5V and support maximum continuous current up to 3A. The switch is controlled by an on/off input (EN), which is capable of interfacing directly with low-voltage control signals. Additional features include a 330Ω on-chip load resistor is added for output quick discharge when switch is turned off.

The APE8988B is available in small SOT-26 package with smallest components.

APPLICATION INFORMATION

On/Off Control

The load switch is controlled by the EN pin. The EN pin is active high and has a low threshold making it capable of interfacing with low voltage signals. The EN pin can be used with standard 1.8V, 2.5V or 3.3V GPIO logic threshold. Do not leave the EN pin float.

The Figure15 shows the VOUT on/off definition.

t_R : VOUT rise time

t_{D-OFF} : VOUT turn-off delay time

Input Capacitor

An input capacitor is recommended to be placed between VIN and GND to limit the voltage drop on the input supply during high current application.

Output Capacitor

Setting a C_{IN} greater than the C_{OUT} is highly recommended. Since the internal body diode is in the NMOS switch, this prevents the current flows through the body diode from VOUT to VIN when the system supply is removed.

Layout Considerations

Follow the below guidelines for PCB layout to achieve stable operation. Take below figure for reference.

1. Keep the high current paths (VIN, VOUT and GND) wide and short to obtain the best effect.
2. The input and output capacitors should be close to the device as possible to minimize the parasitic trace inductances.
