Notes on Operation for RFC Pin

- Set each impedance of the heavy line shown below 0.1Ω or less.
- Make each wiring length of L1 to L4, $L1 \leq 20\text{mm}$, $L2 \leq 20\text{mm}$ and $L3 + L4 \leq 40\text{mm}$.
- Use the bypass condenser C with capacitance led by resistance (regulator output impedance and wiring resistance to C) or more seeing the figure below.

($V_{DD} = X_{VDD} = 2.5 \pm 0.2V$, IOV_{DD0} to 2 = AV_{DD0} to 5 = $3.3 \pm 0.3V$, $V_{SS} = X_{VSS} = IOV_{SS} = AV_{SS} = 0V$, $T_{opr} = -20$ to $+75^{\circ}C$)

DC-DC converter application circuit sample

- (1) C_2 is the oscillation stopping capacitor. Since there is possibility of an oscillation when the capacity value changes by temperature change etc., the electrolytic capacitor with small internal series resistance (ESR) is recommended. Capacitance $100\mu F$ is recommended. (Should be $50\mu F$ or more)
- (2) Since protection circuit is built in the DC-DC converter output, it operates when an overcurrent flows. Cancelling after protection circuit operation needs to make power supply voltage $0.7V$ or less once. After that, when you switch ON power supply, set $XRST$ pin in the condition of low. To cancel the reset, set high after holding $XRST$ low $100ns$ or more after power ON.
- (3) The R_1 and C_1 of application circuit example have the constant assuming that power supply rise time is $400ms$ or less. When it is $400ms$ or more, it is necessary to enlarge the value of $R_1 \times C_1$.
