

XCL303/XCL304 Series

ETR28016-001

Inductor Built-in Negative Output Voltage “micro DC/DC” Converters

☆Green Operation Compatible

■GENERAL DESCRIPTION

The XCL303/XCL304 series are small coil-integrated negative voltage micro DC/DC converter IC. The oscillating frequency is a fast 2.5MHz and the small 2.5 x 2.0 x 1.0mm package contributes significantly to space saving in PCB area.

Further, integrating the coil together with the DC/DC simplifies the circuit board layout and minimizes potential noise interference.

Compared to a charge pump type solution, the switching method of the XCL303/XCL304 maintains a stable output voltage even when the input voltage fluctuates. In addition, this new micro DC/DC can support larger output current than a charge pump solution.

The PWM controlled XCL303 series can be selected for applications where low noise is important, and the PWM/PFM automatic switching controlled XCL304 series can be selected for applications where high efficiency at light load current and low noise at high load current is important.

The XCL303/XCL304 series allows users to select either a PWM control or PWM/PFM automatic switching control method, which are optimum for applications where low noise and high efficiency are important.

Output voltage can be adjusted within the range of -1.2V to -6.0V using externally mounted resistors.

■APPLICATIONS

- Negative power supply for Optical transceiver
- Negative power supply for AMP
- Negative power supply for LCD
- Negative power supply for CCD
- General purpose Negative power supply

■FEATURES

Input Voltage Range	: 2.7V ~ 5.5V
Output Voltage Range	: -1.2V ~ -6.0V
FB Voltage	: 0.5V ± 10mV
V _{REF} Voltage	: 1.6V ± 40mV
Output Current	: 300mA @ V _{OUT} = -3.0V, V _{IN} = 3.3V(TYP.)
Quiescent Current	: 250μA (TYP.)
Control Methods	: PWM Control (XCL303 Series) : PWM/PFM Control (XCL304 Series)
Oscillation Frequency	: 2.5MHz
Protection Function	: Current Limit (1.1A TYP.)
Function	: Soft Start Time External Adjustment UVLO
Operating Ambient Temperature	: -40 ~ +105°C
Packages	: CL-2025-02 (2.5 x 2.0 x 1.0mm)
Environmentally Friendly	: EU RoHS Compliant, Pb Free

■TYPICAL APPLICATION CIRCUIT

■TYPICAL PERFORMANCE CHARACTERISTICS

BLOCK DIAGRAM

* Diodes inside the circuit are an ESD protection diode and a parasitic diode.

* Take capacitance loss, withstand voltage, rated current and other conditions into consideration when selecting components.

* 10μF ~ 44μF output capacitor (C_L) value is recommended.

When the output capacitor (C_L) is large, there is a possibility that the output voltage will be unstable.

* If a tantalum or electrolytic capacitor is used for the output capacitor (C_L), ripple voltage will increase, and there is a possibility that operation will become unstable. Test fully using the actual device.

* When Schottky Diodes, which have a large junction capacity are used, there is a possibility that the output voltage will be unstable.

<Output voltage (V_{OUTSET}) setting>

Output voltage can be set by adding an external resistor.

Output voltage is set by the following equation according to R_{FB1}, R_{FB2}, V_{FB} and V_{REF}.

$$V_{OUTSET} = V_{FB} - R_{FB1} / R_{FB2} \times (V_{REF} - V_{FB})$$

Please select within 100kΩ ≤ R_{FB1} + R_{FB2} ≤ 500kΩ range.

V _{OUTSET}	R _{FB1}	R _{FB2}
-1.2V	200kΩ	130kΩ
-3.3V	150kΩ	43kΩ
-5.0V	220kΩ	43kΩ

■ TYPICAL APPLICATION CIRCUIT

EXTERNAL COMPONENTS SELECTION (Continued)

<Setting soft start time (t_{ss})>

Soft start time is determined by the capacity of the C_{VREF} connected to the V_{REF} terminal.

Please select the capacitance value of C_{VREF} within the range of $0.47\mu\text{F} \sim 10\mu\text{F}$ referring to the below graph.

OPERATIONAL EXPLANATION

This IC consists of a standard voltage reference, error amp, ramp wave circuit, oscillator circuit, PWM comparator, PWM/PFM controller, Pch driver transistor, current sensing circuit, UVLO circuit, V_{REF} startup circuit and etc.

Control method is a current mode control method which allows for the use of low ESR ceramic capacitors.

XCL303/XCL304 Series block diagram

■ OPERATIONAL EXPLANATION (Continued)

<Normal Operation>

The FB terminal voltage divided by the output voltage is compared with the V_{REF} voltage by the error amp. Phase compensation is applied to the error amp output, which is then forwarded to the PWM comparator. At the PWM comparator the error amp output and ramp wave are compared to determine the ON time during PWM control.

The XCL303 series (PWM control) is switched using a constant switching frequency (f_{osc}) independent of the output current.

During light load current, the ON time is short, and the IC operates in a non-continuous mode. As the output current increases, the ON time becomes longer, and the IC operates in a continuous mode.

At high load currents, the ON time depends heavily on the input voltage, output voltage, and output current, and the maximum ON time (t_{ONMAX}) restriction determines the maximum output current that can flow under the conditions of each input voltage and output voltage.

Refer to the typical performance characteristics for the maximum output current under each condition.

XCL303 Series: Example of operation at light load current

XCL303 Series: Example of operation at high load currents

The XCL304 series (PWM/PFM automatic switching control) turns ON the Pch driver transistor until the coil current reaches the PFM current (I_{PFM}) and to lower the switching frequency during light load current. This operation reduces loss during light loads to achieve high efficiency from light to high load currents.

As the output current grows larger, the switching frequency increases proportional to the output current, and when the switching frequency reaches the f_{osc} to switch from PFM control to PWM control the switching frequency is fixed.

XCL304 Series: Example of operation at light load current

XCL304 Series: Example of operation at high load currents

Further, the phase compensation circuit optimizes the error amp frequency characteristics and is used to phase compensate the Pch driver transistor current feedback signal. This achieves output voltage stability even when low ESR capacitors, such as ceramic capacitors are used.

■ OPERATIONAL EXPLANATION (Continued)

<CE Function>

When a "H" voltage (V_{CEH}) is input to the CE terminal, it operates normally after the output voltage is started by the soft start function.

When a "L" voltage (V_{CEL}) is input to the CE terminal, it goes to the stand-by state, the quiescent current is suppressed to the stand-by current I_{STB} (TYP.0 μ A) level and the Pch driver transistor turns OFF.

<UVLO Function>

When the V_{IN} terminal voltage drops below the UVLO detect voltage level (V_{UVLOD}), the UVLO function operates and turns off the Pch driver transistor to prevent any erroneous pulse output due to possible unstable action of the internal circuit.

When the V_{IN} terminal voltage increases above the UVLO release voltage level (V_{UVLOR}), the UVLO function is released. After the UVLO function is released, the soft start function starts the output voltage and the IC operates normally.

The UVLO function operates even if the V_{IN} terminal momentarily drops below the UVLO detect voltage.

In addition, whilst the UVLO function is in operation, rather than being in a stand-by state, the IC is in a switching operation stopped state, so the internal circuit is still operating.

<Soft Start Function>

This gently starts up the output voltage when the IC starts up and the UVLO function is released to suppress the inrush current.

The V_{REF} startup circuit operates after the "H" voltage (V_{CEH}) is input to the CE terminal and after the UVLO function is released. The V_{REF} startup circuit charges the C_{VREF} with current and can gently raise the V_{REF} voltage and FB voltage. In response to this, the output voltage is lowered proportionally to the increase in the V_{REF} voltage and FB voltage. This action makes it possible to prevent input current inrush and to smoothly lower the output voltage.

The output voltage startup time (soft start time) is determined by the capacity of the C_{VREF} connected to the V_{REF} terminal.

In the stand-by state and during the UVLO function operation, the charge accumulated in the C_{VREF} is discharged and the V_{REF} voltage is made to be 0V.

■ OPERATIONAL EXPLANATION (Continued)

<Current Limit Function>

The current limit circuit monitors the current flowing to the Pch driver transistor to restrict overcurrent. The current limit function operates as follows.

- 1) The current flowing to the Pch driver transistor is increased, and when the current limit value of $I_{LIM}=1100\text{mA}$ (TYP.) is reached, the current limit state is entered and the Pch driver transistor is turned OFF.
- 2) The Pch driver transistor is turned OFF for a period of $4\mu\text{s}$ (TYP.), and the coil current is greatly decreased. During this time, lowering the coil current that has reached the current limit lowers the input current and output current while the current is restricted.
- 3) Other switching operations are performed, and when the output voltage is a load resistance that does not reach the set voltage, the coil current increases and the current limit function operates again.
- 4) Operations 1) to 3) are repeated during the current limit state period.
- 5) When the load resistance increases much more than the load resistance during current limit detection, the current limit state is released and the IC automatically returns to normal operation.

■ NOTE ON USE

- 1) For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
- 2) Switching regulators like this DC/DC converter generate spike noise and ripple voltage. This greatly affects the surrounding components (Schottky diodes, capacitors, peripheral component circuit board layout etc.). When making a design, please be sure to sufficiently check this in an actual device.
- 3) The DC/DC converter characteristics greatly depend not only on the characteristics of this IC but also on those of externally connected components, so refer to EXTERNAL COMPONENTS SELECTION and the specifications of each component and be careful when selecting the components. Be especially careful of the characteristics of the capacitor used for the load capacity C_L and use a capacitor with B characteristics (JIS Standard) or an X7R/X5R (EIA Standard) ceramic capacitor.
- 4) The maximum output current of this IC is determined by the current limit value and the maximum ON time restrictions, and this depends greatly on the input voltage and output voltage. Further, when the input voltage is low and during low temperature, there is a possibility that the maximum ON time decreases and the maximum output current drops. For the maximum output current, please refer to the typical performance characteristics of "Maximum Output Current vs. Output Voltage."
- 5) With the XCL303 series, there is a possibility that the switching frequency will decline when the input voltage is high and the load current is light.
- 6) When Schottky Diodes, which have a large junction capacity, are used or when the C_L output capacity is large, there is a possibility that the output voltage will be unstable.
- 7) When there is steep output current fluctuation, there could be a large drop in the output voltage that can cause the duty to increase which in turn triggers the operation of the current limit function.
- 8) If the IC is started under a condition where the output current is large, there is a possibility that the inrush current will increase and the current limit function may operate.
- 9) When the input voltage is lowered below the UVLO detect voltage level for a short time, there are times when it is not possible to discharge the C_{VREF} charge. When the input voltage is started again in this state, the shortening of the soft start time at startup could trigger the current limit function.
- 10) Under the condition where the input voltage is close to 1V, there is a possibility that the UVLO function will not operate.
- 11) Torex places an importance on improving our products and their reliability.
We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
- 12) The proper position of mounting is based on the coil terminal

■ NOTE ON USE (Continued)

13) Note on board layout

1. In order to stabilize V_{IN} voltage level, we recommend that a by-pass capacitor (C_{IN}) be connected as close as possible to the V_{IN} & GND pins.
2. Please mount each external component as close to the IC as possible.
3. Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
4. Make sure that the PCB GND traces are as thick as possible, as variations in ground potential caused by high ground currents at the time of switching may result in instability of the IC.
5. This series' internal driver transistors bring on heat because of the output current and ON resistance of Pch driver transistors.
6. As precautions on mounting, please set the mounting position accuracy within 0.05 mm.

● Recommended Pattern Layout

14) Appearance (Coil)

1. Coils are compliant with general surface mount type chip coil (inductor) specifications and may have scratches, flux contamination and the like.

XCL304A052

$V_{IN} = V_{CE} = 0 \rightarrow 3.7V$, $I_{OUT} = 300mA$

$C_N = 10\mu F$ (GRM188D71A106KA73), $C_L = 10\mu F$ (GRM188D71A106KA73)
 $C_{VREF} = 1\mu F$ (GRM155C71A105KE11), SD: PMEG2010BELD
 $R_{FBI} = 150k\Omega$, $R_{FBZ} = 43k\Omega$

■ PACKAGING INFORMATION

For the latest package information go to, www.torexsemi.com/technical-support/packages

PACKAGE	OUTLINE / LAND PATTERN	THERMAL CHARACTERISTICS	
		Standard Board	CL-2025-02 Power Dissipation
CL-2025-02	CL-2025-02 PKG		

■ MARKING RULE

● CL-2025-02

① Represents products series

MARK	PRODUCT SERIES
N	XCL303*****-G
P	XCL304*****-G

② Represents product type and FB voltage

MARK	PRODUCT TYPE	FB VOLTAGE (V)	PRODUCT SERIES
0	A	0.5	XCL30*A05*KR-G

③ Represents integer of Oscillation frequency

MARK	OSCILLATION FREQUENCY	PRODUCT SERIES
2	2.5MHz	XCL303/4***2KR-G

④, ⑤ represents production lot number

01~09、0A~0Z、11~9Z、A1~A9、AA~AZ、B1~ZZ in order.

(G, I, J, O, Q, W excluded)

Note: No character inversion used.

1. The product and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.
2. The information in this datasheet is intended to illustrate the operation and characteristics of our products. We neither make warranties or representations with respect to the accuracy or completeness of the information contained in this datasheet nor grant any license to any intellectual property rights of ours or any third party concerning with the information in this datasheet.
3. Applicable export control laws and regulations should be complied and the procedures required by such laws and regulations should also be followed, when the product or any information contained in this datasheet is exported.
4. The product is neither intended nor warranted for use in equipment of systems which require extremely high levels of quality and/or reliability and/or a malfunction or failure which may cause loss of human life, bodily injury, serious property damage including but not limited to devices or equipment used in 1) nuclear facilities, 2) aerospace industry, 3) medical facilities, 4) automobile industry and other transportation industry and 5) safety devices and safety equipment to control combustions and explosions. Do not use the product for the above use unless agreed by us in writing in advance.
5. Although we make continuous efforts to improve the quality and reliability of our products; nevertheless Semiconductors are likely to fail with a certain probability. So in order to prevent personal injury and/or property damage resulting from such failure, customers are required to incorporate adequate safety measures in their designs, such as system fail safes, redundancy and fire prevention features.
6. Our products are not designed to be Radiation-resistant.
7. Please use the product listed in this datasheet within the specified ranges.
8. We assume no responsibility for damage or loss due to abnormal use.
9. All rights reserved. No part of this datasheet may be copied or reproduced unless agreed by Torex Semiconductor Ltd in writing in advance.
