# Spread Spectrum Clock Generator

MB88151A is a clock generator for EMI (Electro Magnetic Interference) reduction. The peak of unnecessary radiation noise (EMI) can be attenuated by making the oscillation frequency slightly modulate periodically with the internal modulator. It corresponds to both of the center spread which modulates frequency in modulation off as Middle Centered and down spread which modulates so as not to exceed frequency in modulation off.

## **5. Handling Devices**

### **5.1 Preventing Latch-up**

A latch-up can occur if, on this device, (a) a voltage higher than  $V_{DD}$  or a voltage lower than  $V_{SS}$  is applied to an input or output pin or (b) a voltage higher than the rating is applied between  $V_{DD}$  pin and  $V_{SS}$  pin. The latch-up, if it occurs, significantly increases the power supply current and may cause thermal destruction of an element. When you use this device, be very careful not to exceed the maximum rating.

### **5.2 Handling Unused Pins**

Do not leave an unused input pin open, since it may cause a malfunction. Handle by, using a pull-up or pull-down resistor.

Unused output pin should be opened.

### **5.3 The Attention when the External Clock is Used**

Input the clock to XIN pin, and XOUT pin should be opened when you use the external clock.

Please pay attention so that an overshoot and an undershoot do not occur to an input clock of XIN pin.

### **5.4 Power Supply Pins**

Please design connecting the power supply pin of this device by as low impedance as possible from the current supply source.

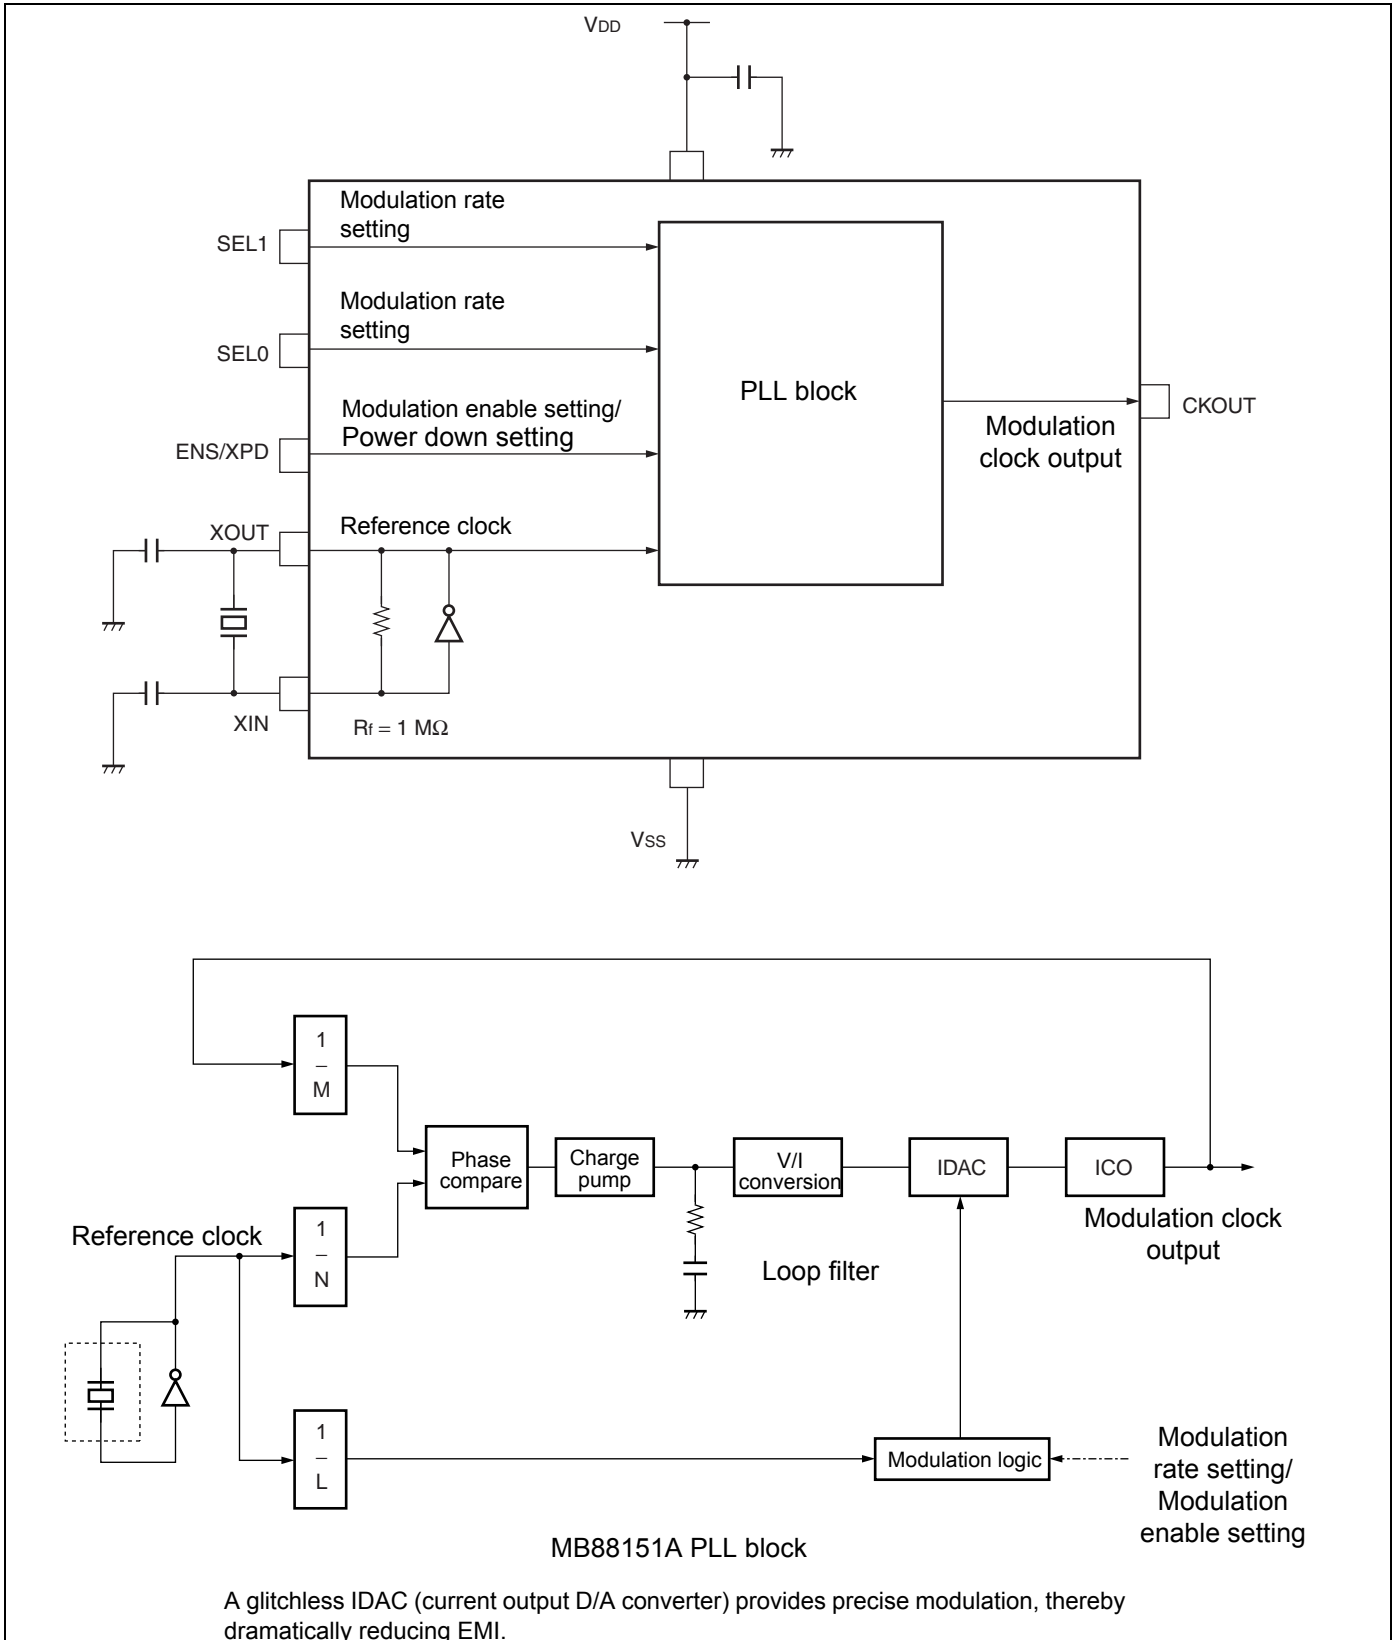

We recommend connecting electrolytic capacitor (about 10  $\mu\text{F}$ ) and the ceramic capacitor (about 0.01  $\mu\text{F}$ ) in parallel between  $V_{SS}$  pin and  $V_{DD}$  pin near the device, as a bypass capacitor.

### **5.5 Oscillation Circuit**

Noise near the XIN and XOUT pins may cause the device to malfunction. Design printed circuit boards so that electric wiring of XIN or XOUT pin and the resonator do not intersect other wiring.

Design the printed circuit board that surrounds the XIN and XOUT pins with ground.

6. Block Diagram

## 7. Pin Setting

When changing the pin setting, the stabilization wait time for the modulation clock is required. The stabilization wait time for the modulation clock take the maximum value of “[Electrical Characteristics AC Characteristics Lock-up time](#)”.

### ENS Modulation Enable Setting (MB88151A-100/200)

ENS	Modulation
L	No modulation
H	Modulation

Note : Spectrum does not spread when “L” is set to ENS. The clock with low jitter can be obtained. Because of ENS has Pull-up resistance, spectrum spread when “H” is set to it or open the terminal.

### SEL0, SEL1 Modulation Rate Setting

SEL1	SEL0	Modulation Rate	Modulation Type
L	L	$\pm 1.5\%$	Center spread
L	H	$\pm 0.5\%$	Center spread
H	L	$- 1.0\%$	Down spread
H	H	$- 3.0\%$	Down spread

Note : The modulation rate can be changed at the level of the terminal.

■ Center Spread

Spectrum is spread (modulated) by centering on the frequency in modulation off.

■ Down Spread

Spectrum is spread (modulated) below the frequency in modulation off.

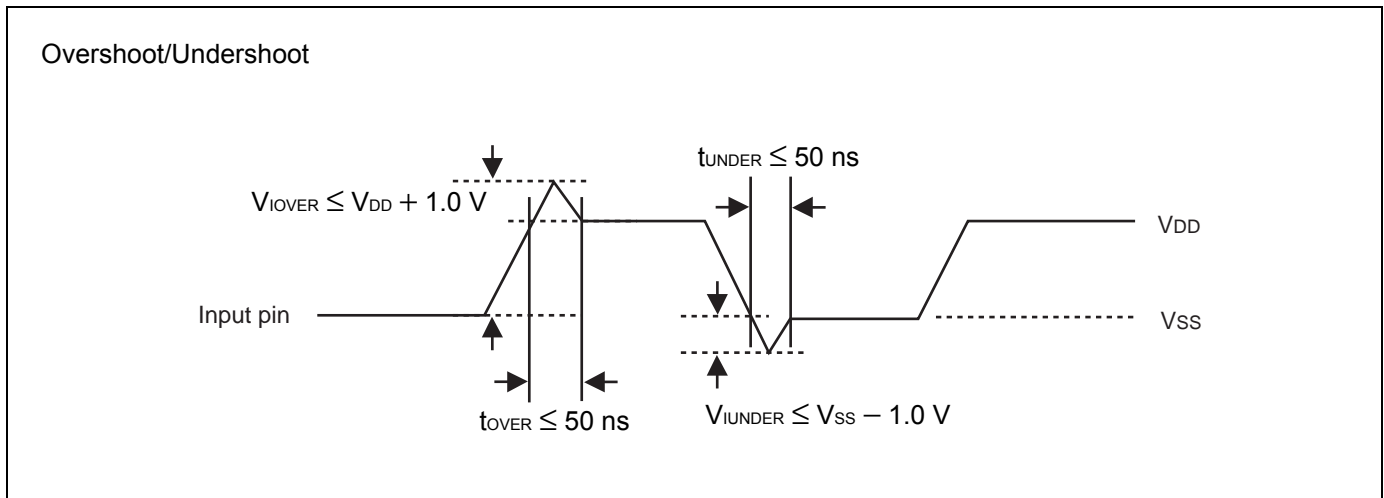

## 8. Absolute Maximum Ratings

\* : The parameter is based on  $V_{SS} = 0.0$  V.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Note : The modulation clock stabilization wait time is required after the power is turned on, the IC recovers from power saving, or after FREQ (frequency range) or ENS (modulation ON/OFF) setting is changed. For the modulation clock stabilization wait time, assign the maximum value for lock-up time.

<Definition of modulation frequency and number of input clocks per modulation>

MB88151A contains the modulation period to realize the efficient EMI reduction.

The modulation period  $f_{MOD}$  depends on the input frequency and changes between  $f_{MOD}$  (Min) and  $f_{MOD}$  (Max) .

Furthermore, the average value of  $f_{MOD}$  equals the typical value of the electrical characteristics.

**11. Output Clock Duty Cycle ( $t_{DCC} = t_b/t_a$ )**

**12. Input Frequency ( $f_{in} = 1/t_{in}$ )**

**13. Output Slew Rate (SR)**

**14. Cycle-cycle Jitter ( $t_{JC} = | t_n - t_{n+1} |$ )**

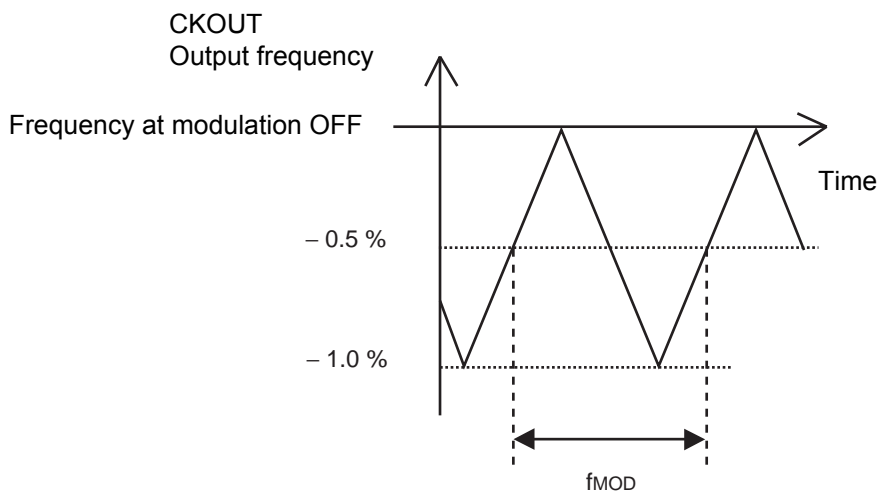

Note : Cycle-cycle jitter is defined the difference between a certain cycle and immediately after (or, immediately before) .

**15. Modulation Waveform**

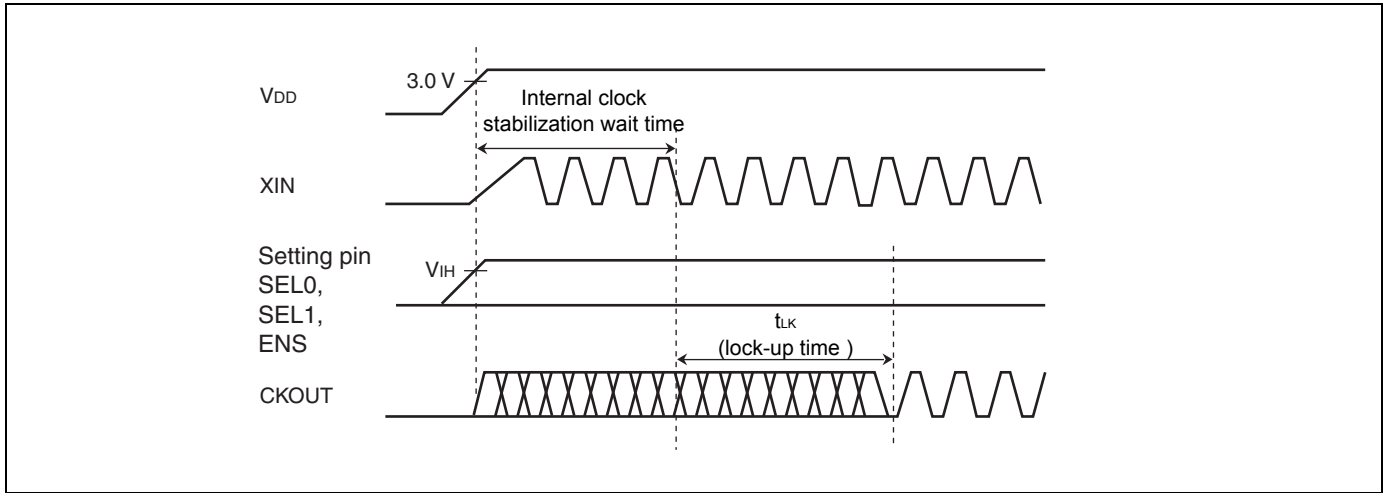

- $\pm 1.5\%$  modulation rate, Example of center spread

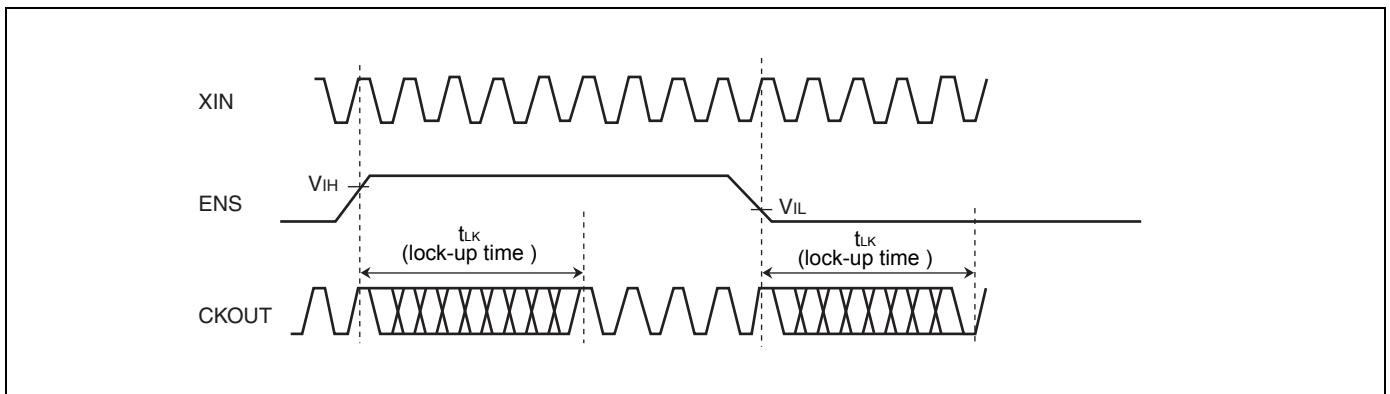

- $-1.0\%$  modulation rate, Example of down spread

## 16. Lock-up Time

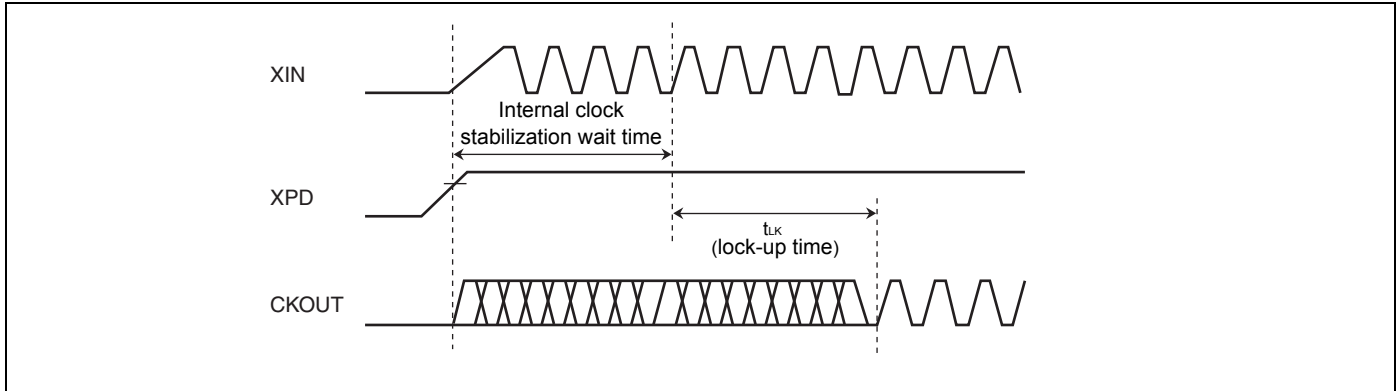

If the setting pin is fixed at the “H” or “L” level, the maximum time after the power is turned on until the set clock signal is output from CKOUT pin is (the stabilization wait time of input clock to XIN pin) + (the lock-up time “t<sub>LK</sub>”). For the input clock stabilization time, check the characteristics of the resonator or oscillator used.

For modulation enable control using the ENS pin during normal operation, the set clock signal is output from CKOUT pin at most the lock-up time (t<sub>LK</sub>) after the level at the ENS pin is determined.

Note : When the pin setting is changed, the CKOUT pin output clock stabilization time is required. Until the output clock signal becomes stable, the output frequency, output clock duty cycle, modulation period, and cycle-cycle jitter cannot be guaranteed. It is therefore advisable to perform processing such as cancelling a reset of the device at the succeeding stage after the lock-up time.

When the power down is controlled by XPD pin, the desired clock is obtained after the pin is set to H level until the maximum lock-up time  $t_{LK}$  is elapsed.

## 17. Oscillation Circuit

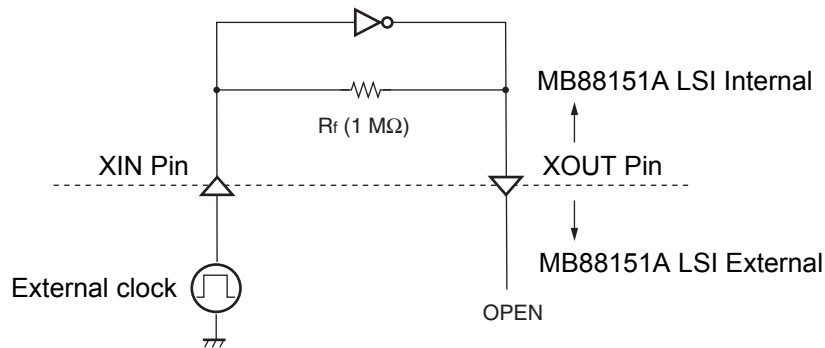

The figure below shows the connection example about general resonator. The oscillation circuit has the built-in resistance ( $R_f$ ). The value of capacity ( $C_1$  and  $C_2$ ) is required adjusting to the most suitable value of individual resonator. The most suitable value is different by individual resonator. Please refer to the resonator manufacturer which you use for the most suitable value.

Input the clock to XIN pin, and do not connect anything with XOUT pin if you use the external clock (you do not use the resonator).

■ When using the resonator

■ When using an external clock

Note : Note that a jitter characteristic of an input clock may cause an affect a cycle-cycle jitter characteristic.

**18. Interconnection Circuit Example**

- C<sub>1</sub>, C<sub>2</sub> : Oscillation stabilization capacitance (refer to "Oscillation Circuit".)
- C<sub>3</sub> : Capacitor of 10 μF or higher
- C<sub>4</sub> : Capacitor about 0.01 μF (connect a capacitor of good high frequency property (ex. laminated ceramic capacitor) to close to this device.)
- R<sub>1</sub> : Impedance matching resistor for board pattern

### 19. Spectrum Example Characteristics

The condition of the examples of the characteristic is shown as follows : Input frequency = 20 MHz (Output frequency = 20 MHz : Using MB88151A-100 (Multiply-by-1)), Power - supply voltage = 3.3 V, None load capacity, Modulation rate =  $\pm 1.5\%$  (center spread). Spectrum analyzer HP4396B is connected with CKOUT. The result of the measurement with RBW = 1 kHz (ATT use for -6dB).
