

GENERAL DESCRIPTION

The ICS8344-01 is a low voltage, low skew fanout buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The ICS8344-01 has two selectable clock inputs. The CLK0, nCLK0 and CLK1, nCLK1 pairs can accept most standard differential input levels. The ICS8344-01 is designed to translate any differential signal levels to LVCMOS levels. The low impedance LVCMOS outputs are designed to drive 50Ω series or parallel terminated transmission lines. The effective fanout can be increased to 48 by utilizing the ability of the outputs to drive two series terminated lines. Redundant clock applications can make use of the dual clock input. The dual clock inputs also facilitate board level testing. The clock enable is internally synchronized to eliminate runt pulses on the outputs during asynchronous assertion/deassertion of the clock enable pin. The outputs are driven low when disabled. The ICS8344-01 is characterized at full 3.3V, full 2.5V and mixed 3.3V input and 2.5V output operating supply modes.

Guaranteed output and part-to-part skew characteristics make the ICS8344-01 ideal for those clock distribution applications demanding well defined performance and repeatability.

FEATURES

- 24 LVCMOS outputs, 7Ω typical output impedance
- 2 selectable CLKx, nCLKx inputs
- CLK0, nCLK0 and CLK1, nCLK1 pairs can accept the following input levels: LVDS, LVPECL, LVHSTL, SSTL, HCSL
- Output frequency up to 250MHz
- Translates any single ended input signal to LVCMOS with resistor bias on nCLK input
- Synchronous clock enable
- Output skew: 200 ps (maximum)
- Part-to-part skew: 900ps (maximum)
- Bank skew: 85ps (maximum)
- Propagation delay: 5ns (maximum)
- 3.3V, 2.5V or mixed 3.3V, 2.5V operating supply modes
- 0°C to 70°C ambient operating temperature
- Industrial temperature information available upon request

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 2, 5, 6 7, 8, 11, 12	Q16, Q17, Q18, Q19 Q20, Q21, Q22, Q23	Output		Q16 thru Q23 outputs. 7Ω typical output impedance.
3, 9, 28, 34, 39, 45	V _{DDO}	Power		Output supply pins. Connect 3.3V or 2.5V.
4, 10, 14, 18, 27, 33, 40, 46	GND	Power		Power supply ground. Connect to ground.
13	CLK_SEL	Input	Pulldown	Clock select input. When HIGH, selects CLK1, nCLK inputs, When LOW, selects CLK0, nCLK0 inputs. LVCMOS / LVTTTL interface levels.
15, 19	V _{DD}	Power		Positive supply pins. Connect 3.3V or 2.5V.
16	nCLK1	Input	Pullup	Inverting differential LVPECL clock input.
17	CLK1	Input	Pulldown	Non-inverting differential LVPECL clock input.
20	nCLK0	Input	Pullup	Inverting differential LVPECL clock input.
21	CLK0	Input	Pulldown	Non-inverting differential LVPECL clock input.
22	CLK_EN	Input	Pullup	Synchronizing control for enabling and disabling clock outputs. LVCMOS interface levels.
23	OE	Input	Pullup	Output enable. Controls enabling and disabling of outputs Q0 thru Q23.
24	nc	Unused		No connect.
25, 26, 29, 30 31, 32, 35, 36	Q0, Q1, Q2, Q3 Q4, Q5, Q6, Q7	Output		Q0 thru Q7 outputs. 7Ω typical output impedance.
37, 38, 41, 42 43, 44, 47, 48	Q8, Q9, Q10, Q11 Q12, Q13, Q14, Q15	Output		Q8 thru Q15 outputs. 7Ω typical output impedance.

NOTE: *Pullup* and *Pulldown* refers to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Supply Voltage, V_{DDx}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_O	-0.5V to $V_{DDO} + 0.5V$
Package Thermal Impedance, θ_{JA}	47.9°C/W (0lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

All parameters measured at 200MHz and VPtyp unless noted otherwise.

NOTE 1: Measured from the differential input crossing point to the output crossing point.

NOTE 2: Defined as skew within a bank of outputs at the same voltages and with equal load conditions.

NOTE 3: Defined as skew across banks of outputs at the same supply voltages and with equal load conditions.

NOTE 4: Defined as between outputs at the same supply voltages and with equal load conditions. Measured at the output differential cross points.

NOTE 5: These parameters are guaranteed by characterization. Not tested in production.

NOTE 6: This parameter is defined in accordance with JEDEC Standard 65.

APPLICATION INFORMATION

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 8 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} \approx V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

FIGURE 8 - SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS8344-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS8344-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.465V * 95mA = \mathbf{329.2mW}$
- Power (outputs)_{MAX} = **32mW/Loaded Output pair**
If all outputs are loaded, the total power is $24 * 32mW = \mathbf{768mW}$

$$\mathbf{Total\ Power_{MAX} (3.465V, with all outputs switching) = 329.2mW + 768mW = 1097.2mW}$$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = junction-to-ambient thermal resistance

Pd_total = Total device power dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 6 below. Therefore, T_j for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ C + 0.1097W * 42.1^\circ C/W = 74.6^\circ C. \text{ This is well below the limit of } 125^\circ C$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

Table 6. Thermal Resistance θ_{JA} for 48-pin LQFP, Forced Convection

θ_{JA} by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W
NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.			

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVCMOS output driver circuit and termination are shown in *Figure 9*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{DD} - 2V$.

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = (V_{OH_MAX} / R_L) * (V_{DD_MAX} - V_{OH_MAX})$$

$$Pd_L = (V_{OL_MAX} / R_L) * (V_{DD_MAX} - V_{OL_MAX})$$

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{DD_MAX} - 1.2V$
- For logic low, $V_{OUT} = V_{OL_MAX} = V_{DD_MAX} - 0.4V$

$$Pd_H = (1.2V/50\Omega) * (2V - 1.2V) = \mathbf{19.2mW}$$

$$Pd_L = (0.4V/50\Omega) * (2V - 0.4V) = \mathbf{12.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = \mathbf{32mW}$$
