Note: For XIN and XOUT pins, refer to “Oscillation Circuit”.

5. Handling Devices

Preventing Latch-up

A latch-up can occur if, on this device, (a) a voltage higher than V_{DD} or a voltage lower than V_{SS} is applied to an input or output pin or (b) a voltage higher than the rating is applied between V_{DD} and V_{SS} pins. The latch-up, if it occurs, significantly increases the power supply current and may cause thermal destruction of an element. When you use this device, be very careful not to exceed the maximum rating.

Handling Unused Pins

- Do not leave an unused input pin open, since it may cause a malfunction. Handle by, using a pull-up or pull-down resistor.
- Unused output pin should be opened.

The Attention when the External Clock is Used

- Input the clock to XIN pin, and XOUT pin should be opened when you use the external clock.
- Please pay attention so that an overshoot and an undershoot do not occur to an input clock of XIN pin.

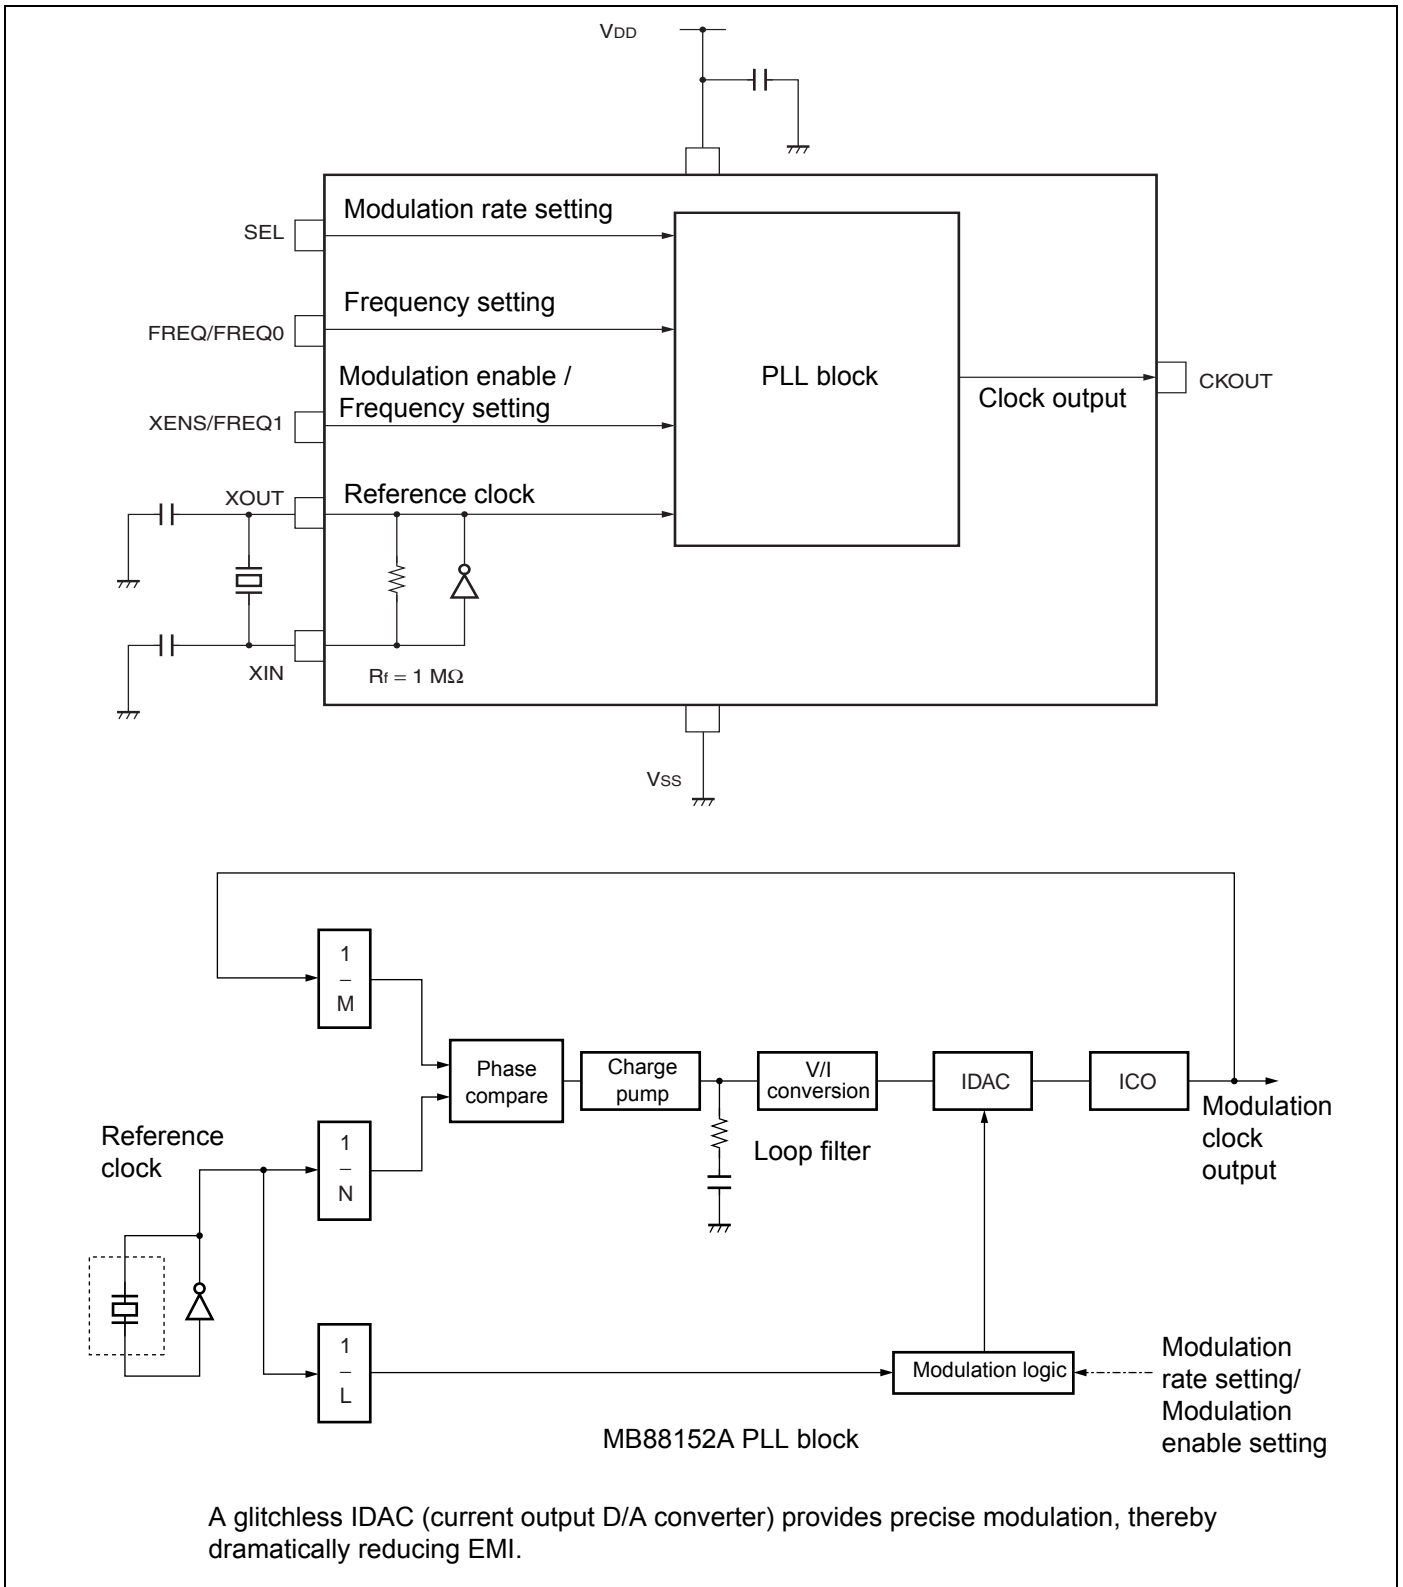

Power Supply Pins

- Please design connecting the power supply pin of this device by as low impedance as possible from the current supply source.
- We recommend connecting electrolytic capacitor (about 10 μF) and the ceramic capacitor (about 0.01 μF) in parallel between V_{SS} and V_{DD} pins near the device, as a bypass capacitor.

Oscillation Circuit

- Noise near the XIN and XOUT pins may cause the device to malfunction. Design printed circuit boards so that electric wiring of XIN or XOUT pin and resonator (or ceramic oscillator) do not intersect other wiring.
- Design the printed circuit board that surrounds the XIN and XOUT pins with ground.

<Definition of modulation frequency and number of input clocks per modulation>

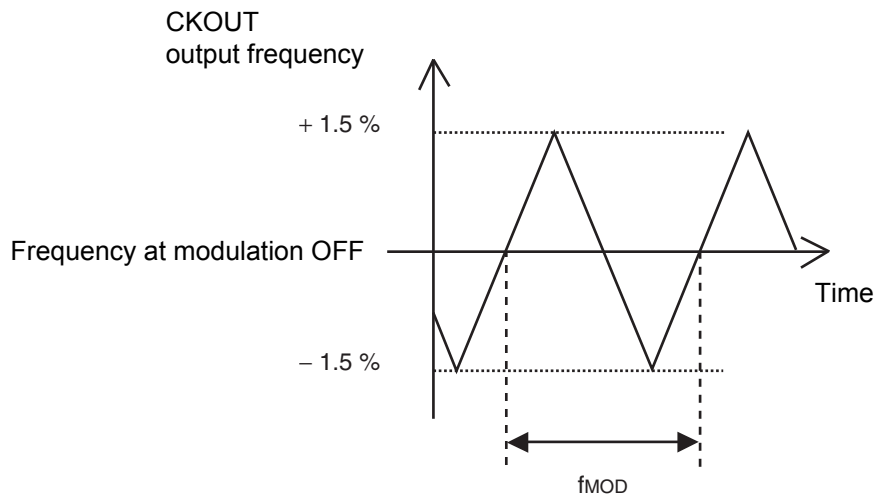

- MB88152A contains the modulation period to realize the efficient EMI reduction.
- The modulation period f_{MOD} depends on the input frequency and changes between $f_{MOD} (Min)$ and $f_{MOD} (Max)$.
- Furthermore, the average value of f_{MOD} equals the typical value of the electrical characteristics.

12. Input Frequency ($f_{in} = 1/t_{in}$)

13. Output Slew Rate (SR)

14. Cycle-cycle Jitter ($t_{JC} = |t_n - t_{n+1}|$)

15. Modulation Waveform

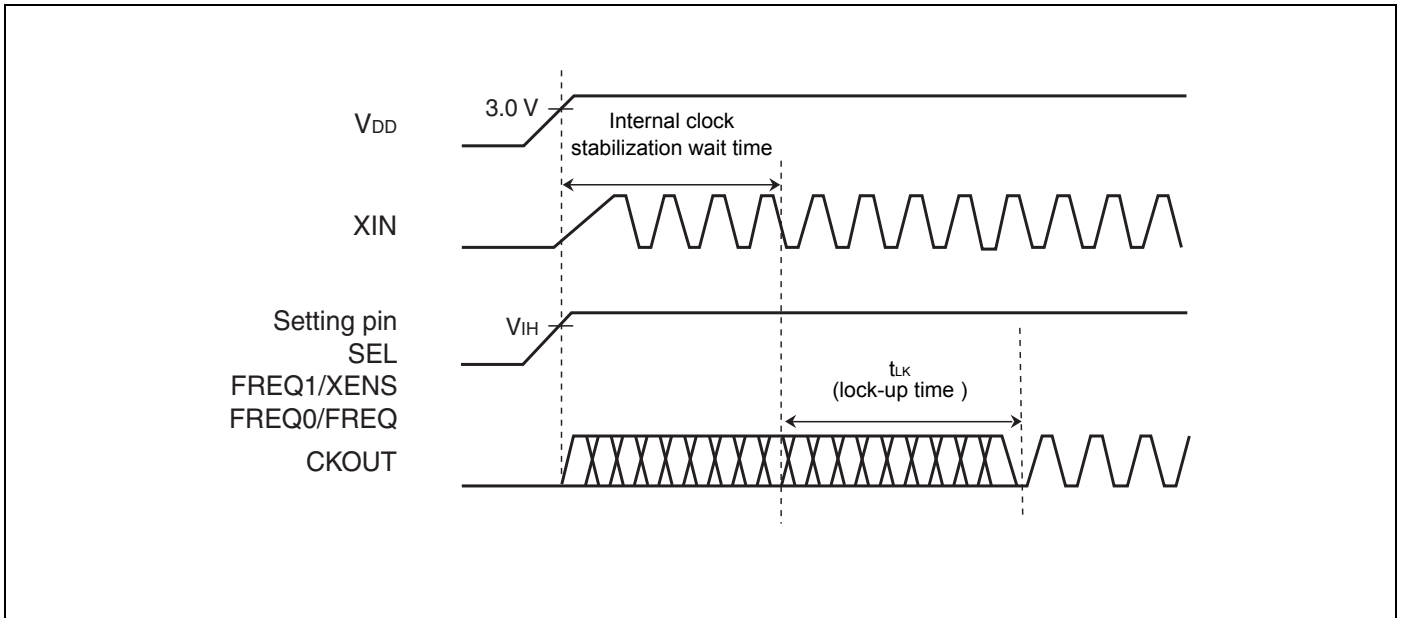

$\pm 1.5\%$ modulation rate, Example of center spread

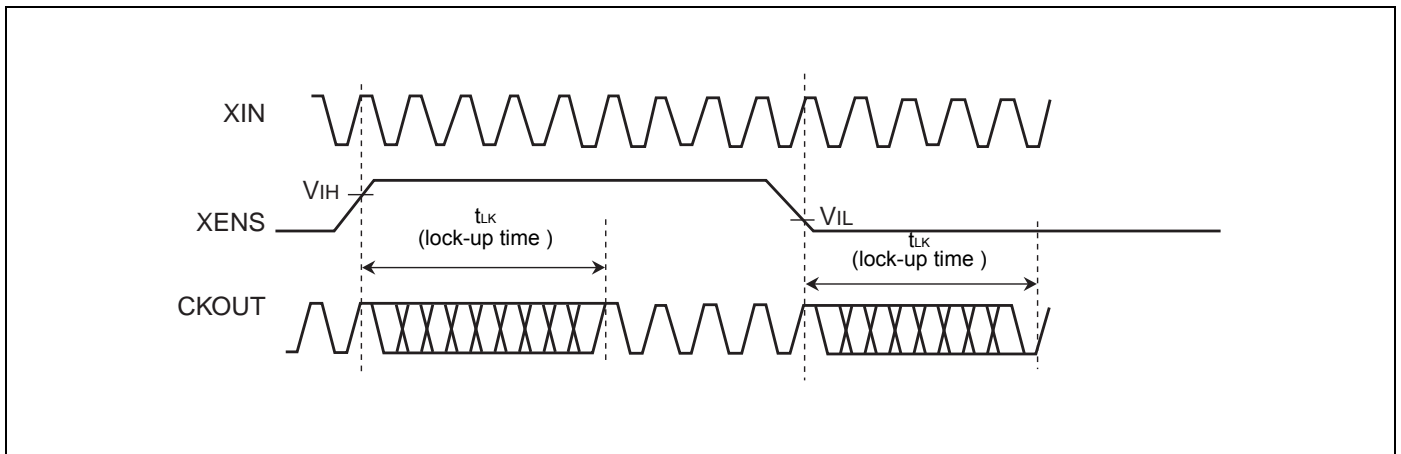

-1.0% modulation rate, Example of down spread

16. Lock-up Time

If the setting pin is fixed at the “H” or “L” level, the maximum time after the power is turned on until the set clock signal is output from CKOUT pin is (the stabilization wait time of input clock to XIN pin) + (the lock-up time “ t_{LK} ”). For the input clock stabilization time, check the characteristics of the resonator or oscillator used.

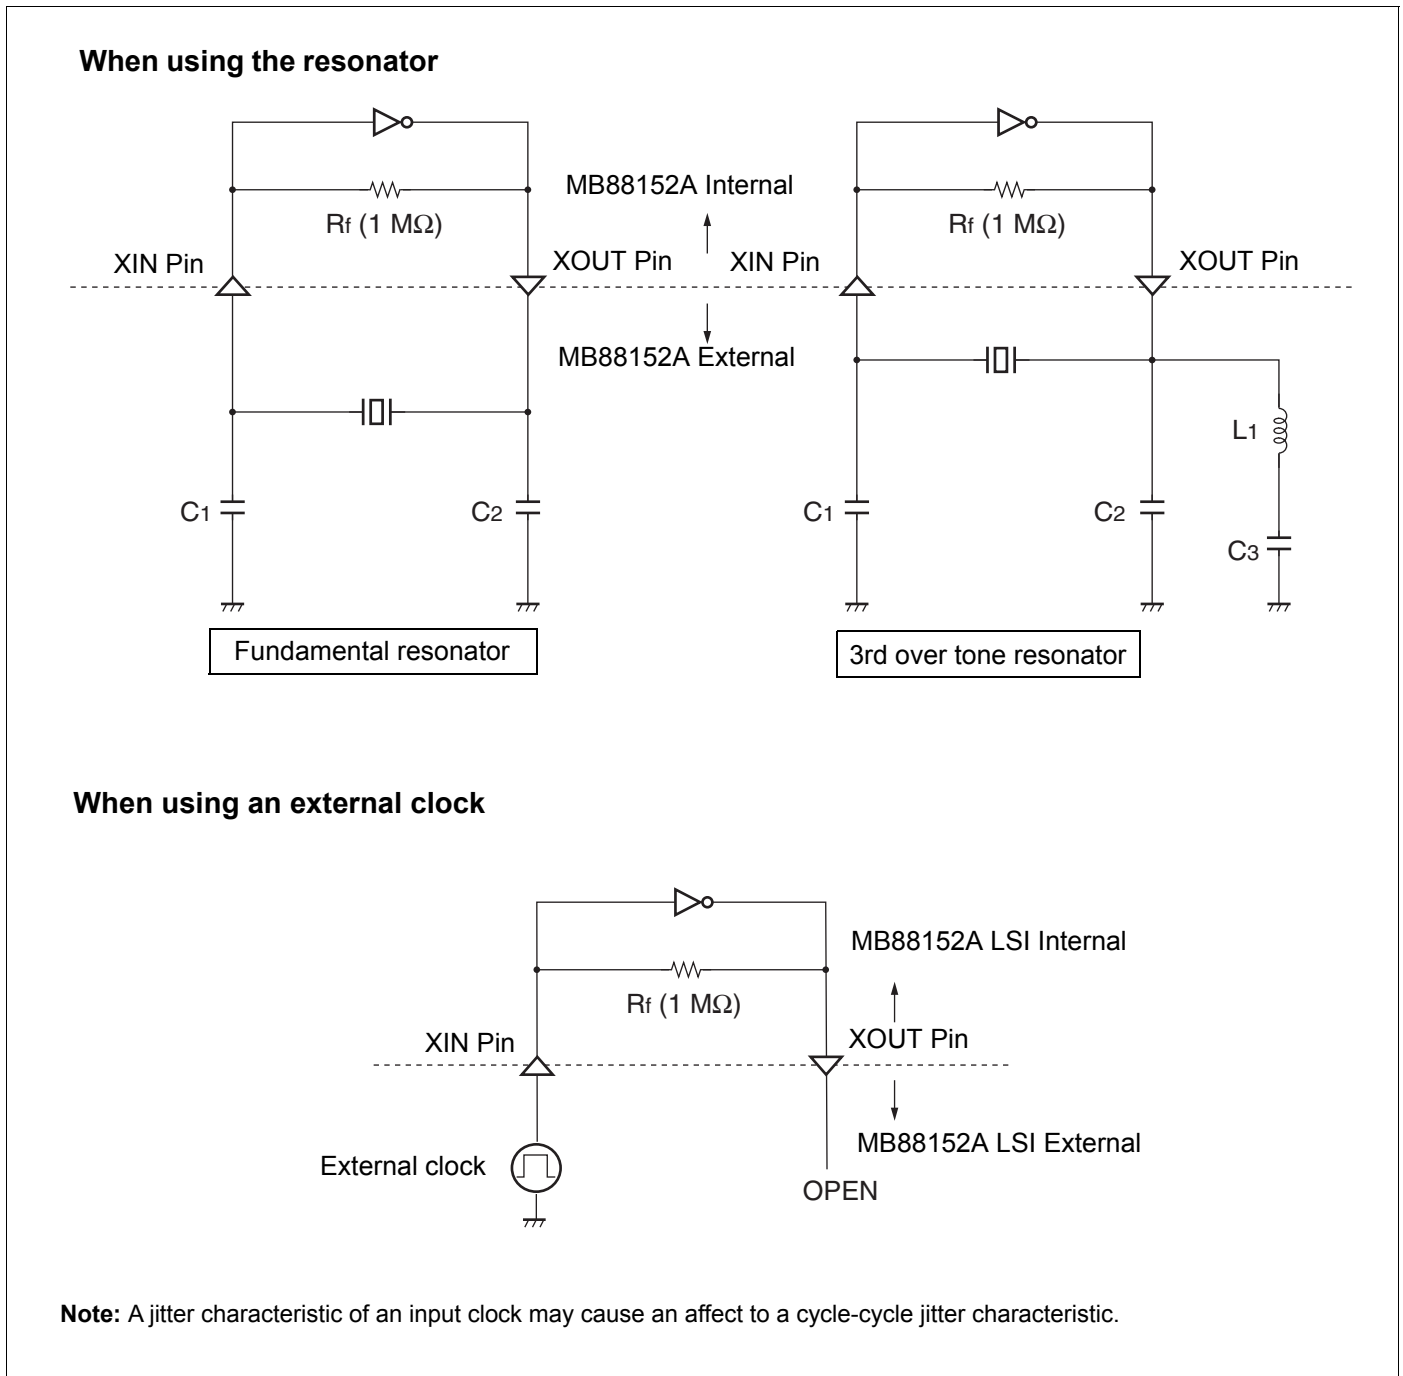

For modulation enable control using the XENS pin during normal operation, the set clock signal is output from CKOUT pin at most the lock-up time (t_{LK}) after the level at the XENS pin is determined.

Note: When the pin setting is changed, the CKOUT pin output clock stabilization time is required. Until the output clock signal becomes stable, the output frequency, output clock duty cycle, modulation period, and cycle-cycle jitter cannot be guaranteed. It is therefore advisable to perform processing such as cancelling a reset of the device at the succeeding stage after the lock-up time.

17. Oscillation Circuit

The left side of figures below shows the connection example about general resonator. The oscillation circuit has the built-in feedback resistance (R_f). The value of capacity (C_1 and C_2) is required adjusting to the most suitable value of an individual resonator. The right side of figures below shows the example of connecting for the 3rd over-tone resonator. The value of capacity (C_1 , C_2 and C_3) and inductance (L_1) is needed adjusting to the most suitable value of an individual resonator. The most suitable value is different by individual resonator. Please refer to the resonator manufacturer which you use for the most suitable value. When an external clock is used (the resonator is not used), input the clock to XIN pin and do not connect anything with XOUT pin.

18. Interconnection Circuit Example

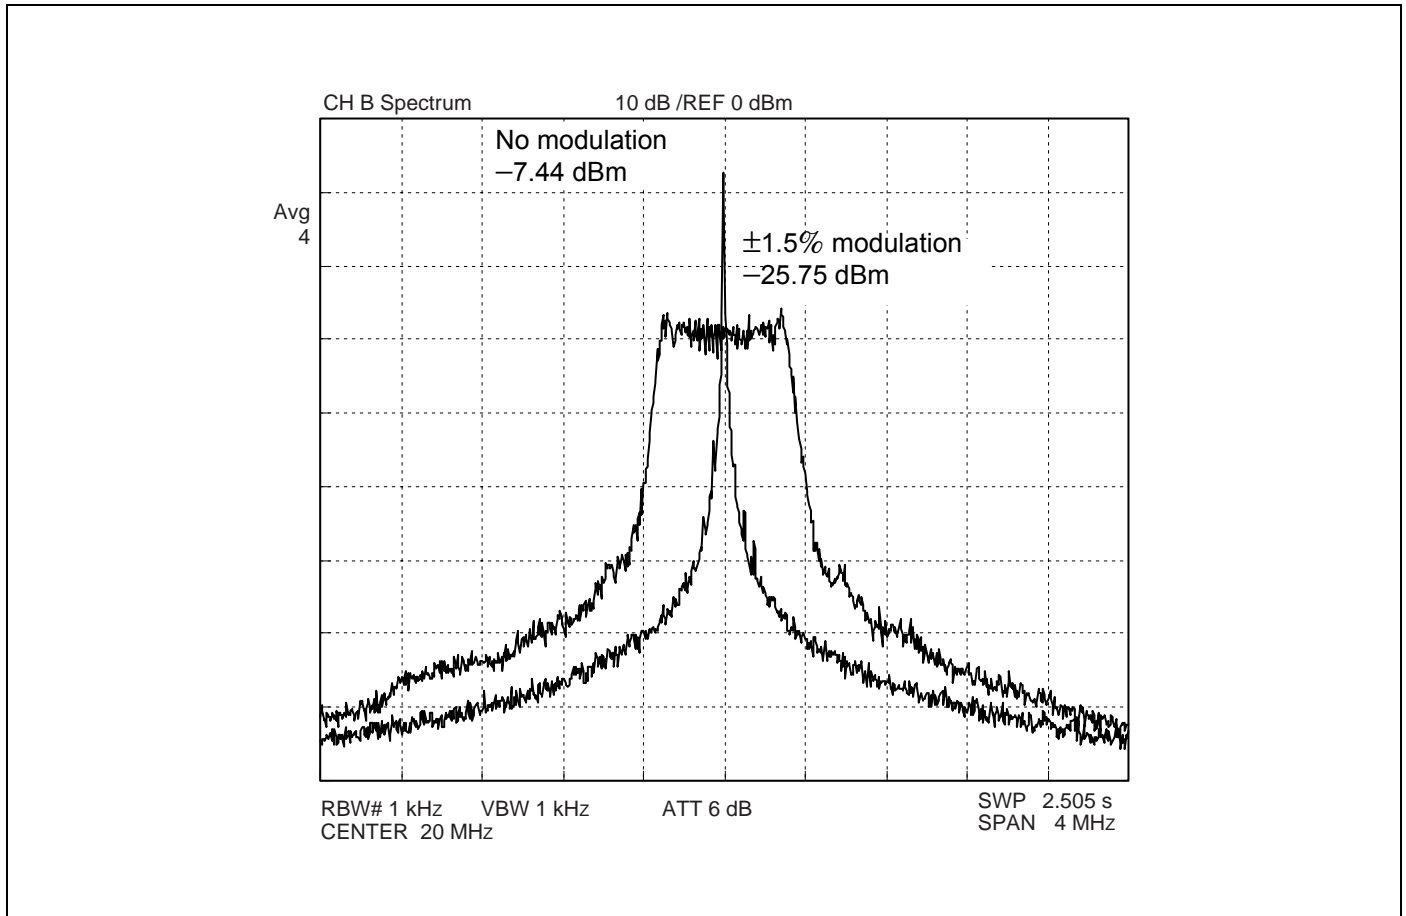

- C₁, C₂ : Oscillation stabilization capacitance (refer to "[Oscillation Circuit](#)".)
- C₃ : Capacitor of 10 μF or higher
- C₄ : Capacitor about 0.01 μF (connect a capacitor of good high frequency property (ex. laminated ceramic capacitor) to close to this device.)
- R₁ : Impedance matching resistor for board pattern

19. Example Characteristics

The condition of the examples of the characteristics is shown as follows : Input frequency = 20 MHz (Output frequency = 20 MHz : Use for MB88152A-111)

Power-supply voltage = 3.3 V, None load capacity, Modulation rate = $\pm 1.5\%$ (center spread) .

Spectrum analyzer HP4396B is connected with CKOUT. The result of the measurement with, RBW = 1 kHz (ATT use for -6 dB) .
