UPSSL150

Preliminary

LINEAR INTEGRATED CIRCUIT

NON ISOLATED BUCK CONSTANT CURRENT LED DRIVER IC

DESCRIPTION

UPSSL150 is a high precision LED BUCK constant current driver chip. The chip operates in the inductor current critical continuous mode, which is suitable for the non isolated buck LED constant current power supply with 85Vac~265Vac full range input voltage.

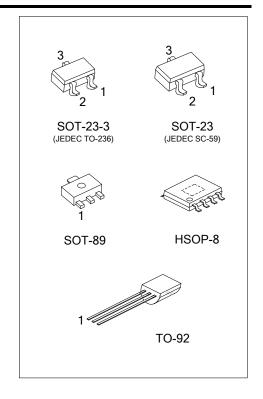

UPSSL150 chip integrated 500V power switch by patent demagnetization detection technology and high voltage power supply technology, without detection and power supply for auxiliary winding, the peripheral devices are more simple, saving the cost and volume of the system.

UPSSL150 chip with high precision current sampling circuit, while the use of patented constant current control technology to achieve high accuracy of the LED constant current output and excellent line voltage regulator. The chip operates in the critical mode of inductor current and the output current is not changed with the increase of the inductance and the working voltage of LED.

UPSSL150 has a variety of protection features, including LED short circuit protection, under voltage protection, over temperature adjustment function and so on.

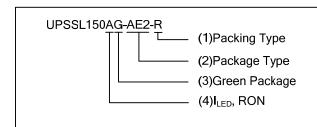

■ FEATURES

- * The integrated 500V power mos.
- * The integrated high voltage power supply function.
- * The inductor current critical continuous mode.
- * Without auxiliary winding detection and power supply.
- * The wide voltage input voltage.
- * ±5% LED output current accuracy.
- * The LED short circuit and open circuit protection.
- * The chip power supply under voltage protection.
- * The regulating function of overheating

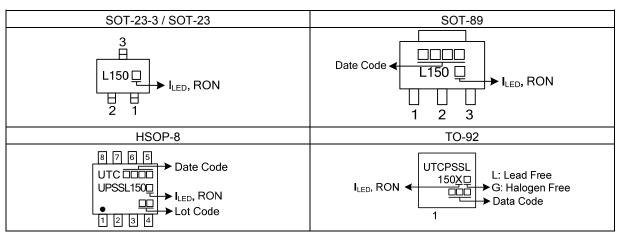

■ ORDERING INFORMATION

APPLICATION INFORMATION

UPSSL150 is a constant current driver IC for LED lighting, which is applied to the non isolated LED driver power supply.

The 500V power switch is integrated in the chip, which is based on the constant current architecture and control method, and it can achieve excellent constant current characteristics with minimal external components.

And without auxiliary winding power supply and testing, the system cost is very low.

Start

After the system is powered up, the input voltage is charged on the V_{DD} pin through the jfet, and when the V_{DD} voltage reaches the threshold value, the chip's internal reference circuit begins to work. When the chip is working normally, the required operating current is still through the supply of internal consumption.

Constant current control

The chip is detected the peak current, and the RCS resistance is connected to the input terminal of the peak comparator, which is compared with the threshold voltage 0.6V. When the RCS voltage reaches the threshold, the LED current is adjusted, and realized the constant current control.

The formula for calculating the inductor peak current is I_{PK}=600/RCS (mA).

Among them, RCS is a current sampling resistor.

The output of the comparator CS also includes a 500ns leading edge blanking time.

The formula for calculating the LED average current is ILED=I_{PK}/2.

Among them, I_{PK} is the inductor peak current.

Protection function

UPSSL150 built in a variety of protection functions, including LED short-circuit protection, LED open circuit protection, sampling circuit short-circuit protection, temperature regulation and protection, etc.

When LED short circuit, the system works in the 3 KHz low frequency, so the power consumption is very low.

Over temperature adjustment function

UPSSL150 has the function of over temperature adjustment, the output current is gradually reduced when the driving power is over, so that the output power and temperature rise is controlled, the power supply is maintained at the set value,

In order to improve the reliability of the system, the chip is internally set to adjust the temperature of the 140°C.

PCB design

In the design of PCB, you need to follow the following guidelines:

 V_{DD} bypass capacitor is required to close the V_{DD} pin of the chip.

RCS resistor requires close to the CS pin of the chip

Between RCS and V_{DD} bypass capacitor resistor connected to the copper foil as short as possible

CS pin increases in the area of copper clad to improve chip cooling.
