

VERY LOW POWER, NEGATIVE RAIL INPUT, RAIL-TO-RAIL OUTPUT, FULLY DIFFERENTIAL AMPLIFIER

Check for Samples: [THS4521-HT](#)

FEATURES

- Fully Differential Architecture
- Bandwidth: 40.7 MHz (210°C)
- Slew Rate: 353.5 V/μs (210°C)
- HD₂: –96 dBc at 1 kHz (1 V_{RMS}, R_L = 1 kΩ) (210°C)
- HD₃: –91.5 dBc at 1 kHz (1 V_{RMS}, R_L = 1 kΩ) (210°C)
- Input Voltage Noise: 19.95 nV/√Hz (f = 100 kHz)
- Open-Loop Gain: 90 dB (typ) (210°C)
- NRI—Negative Rail Input
- RRO—Rail-to-Rail Output
- Output Common-Mode Control (with Low Offset and Drift)
- Power Supply:
 - Voltage: 2.5 V (±1.25 V) to 3.3 V (±1.65 V)
 - Current: 1.4 mA/ch (3.3 V)
- Power-Down Capability: 10 μA (typ) (210°C)

APPLICATIONS

- Down-Hole Drilling
- High Temperature Environments

SUPPORTS EXTREME TEMPERATURE APPLICATIONS

- Controlled Baseline
- One Assembly/Test Site
- One Fabrication Site
- Available in Extreme (–55°C/210°C) Temperature Range⁽¹⁾
- Extended Product Life Cycle
- Extended Product-Change Notification
- Product Traceability
- Texas Instruments high temperature products utilize highly optimized silicon (die) solutions with design and process enhancements to maximize performance over extended temperatures.

(1) Custom temperature ranges available

DESCRIPTION

The THS4521 is a very low-power, fully differential op amp with rail-to-rail output and an input common-mode range that includes the negative rail. This amplifier is designed for low-power data acquisition systems and high-density applications where power dissipation is a critical parameter, and provides exceptional performance in audio applications.

The THS4521 features accurate output common-mode control that allows for dc-coupling when driving analog-to-digital converters (ADCs). This control, coupled with an input common-mode range below the negative rail as well as rail-to-rail output, allows for easy interfacing between single-ended, ground-referenced signal sources. Additionally, this device is ideally suited for driving both successive-approximation register (SAR) and delta-sigma ($\Delta\Sigma$) ADCs using only a single 2.5-V to 3.3-V and ground power supply.

The THS4521 is characterized for operation from –55°C to 210°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- (1) See data sheet for absolute maximum and minimum recommended operating conditions.
- (2) Silicon operating life design goal is 10 years at 105°C junction temperature (does not include package interconnect life).
- (3) The predicted operating lifetime vs. junction temperature is based on reliability modeling using electromigration as the dominant failure mechanism affecting device wearout for the specific device process and design characteristics.
- (4) Device is qualified to ensure reliable operation for 1000 hours at maximum rated temperature. This includes, but is not limited to temperature bake, temperature cycle, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits. For plastic package only.

TEST CIRCUITS

Overview

The THS4521 is tested with the test circuits shown in this section; all circuits are built using the available THS4521 evaluation module (EVM). For simplicity, power-supply decoupling is not shown; see the layout in the [Applications](#) section for recommendations. Depending on the test conditions, component values change in accordance with [Table 2](#) and [Table 3](#), or as otherwise noted. In some cases the signal generators used are ac-coupled and in others they dc-coupled 50-Ω sources. To balance the amplifier when ac-coupled, a 0.22-μF capacitor and 49.9-Ω resistor to ground are inserted across R_{IT} on the alternate input; when dc-coupled, only the 49.9-Ω resistor to ground is added across R_{IT} . A split power supply is used to ease the interface to common test equipment, but the amplifier can be operated in a single-supply configuration as described in the [Applications](#) section with no impact on performance. Also, for most of the tests, except as noted, the devices are tested with single-ended inputs and a transformer on the output to convert the differential output to single-ended because common lab test equipment has single-ended inputs and outputs. Similar or better performance can be expected with differential inputs and outputs.

As a result of the voltage divider on the output formed by the load component values, the amplifier output is attenuated. The **Atten** column in [Table 3](#) shows the attenuation expected from the resistor divider. When using a transformer at the output (as shown in [Figure 28](#)), the signal sees slightly more loss because of transformer and line loss; these numbers are approximate.

Table 2. Gain Component Values for Single-Ended Input⁽¹⁾

Gain	R_F	R_G	R_{IT}
1 V/V	1 kΩ	1 kΩ	52.3 Ω
2 V/V	1 kΩ	487 Ω	53.6 Ω
5 V/V	1 kΩ	187 Ω	59.0 Ω
10 V/V	1 kΩ	86.6 Ω	69.8 Ω

- Gain setting includes 50-Ω source impedance. Components are chosen to achieve gain and 50-

Ω input termination.

Table 3. Load Component Values For 1:1 Differential to Single-Ended Output Transformer⁽¹⁾

R_L	R_O	R_{OT}	Atten
100 Ω	24.9 Ω	Open	6 dB
200 Ω	86.6 Ω	69.8 Ω	16.8 dB
499 Ω	237 Ω	56.2 Ω	25.5 dB
1 kΩ	487 Ω	52.3 Ω	31.8 dB

- Total load includes 50-Ω termination by the test equipment. Components are chosen to achieve load and 50-Ω line termination through a 1:1 transformer.

Frequency Response

The circuit shown in [Figure 27](#) is used to measure the frequency response of the circuit.

An HP network analyzer is used as the signal source and the measurement device. The output impedance of the HP network analyzer is dc-coupled and is 50 Ω. R_{IT} and R_G are chosen to impedance-match to 50 Ω and maintain the proper gain. To balance the amplifier, a 49.9-Ω resistor to ground is inserted across R_{IT} on the alternate input.

The output is probed using a Tektronix high-impedance differential probe across the 953-Ω resistor and referred to the amplifier output by adding back the 0.42-dB because of the voltage divider on the output.

Figure 27. Frequency Response Test Circuit

Distortion

The circuit shown in [Figure 28](#) is used to measure harmonic and intermodulation distortion of the amplifier.

An HP signal generator is used as the signal source and the output is measured with a Rhode and Schwarz spectrum analyzer. The output impedance of the HP signal generator is ac-coupled and is 50 Ω. R_{IT} and R_G are chosen to impedance match to 50 Ω and maintain the proper gain. To balance the amplifier, a 0.22-μF capacitor and 49.9-Ω resistor to ground are inserted across R_{IT} on the alternate input.

A low-pass filter is inserted in series with the input to reduce harmonics generated at the signal source. The level of the fundamental is measured and then a high-pass filter is inserted at the output to reduce the fundamental so it does not generate distortion in the input of the spectrum analyzer.

The transformer used in the output to convert the signal from differential to single-ended is an ADT1-1WT. It limits the frequency response of the circuit so that measurements cannot be made below approximately 1 MHz.

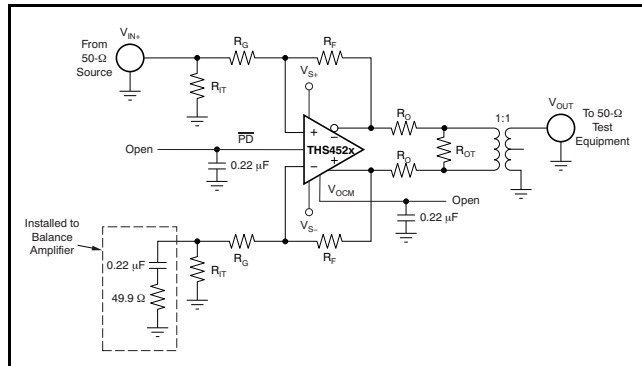

Figure 28. Distortion Test Circuit

Slew Rate, Transient Response, Settling Time, Output Impedance, Overdrive, Output Voltage, and Turn-On/Turn-Off Time

The circuit shown in [Figure 29](#) is used to measure slew rate, transient response, settling time, output impedance, overdrive recovery, output voltage swing, and amplifier turn-on/turn-off time. Turn-on and turn-off time are measured with the same circuit modified for 50-Ω input impedance on the PD input by replacing the 0.22-μF capacitor with a 49.9-Ω resistor. For output impedance, the signal is injected at V_{OUT} with V_{IN} open; the drop across the 2x 49.9-Ω resistors is then used to calculate the impedance seen looking into the amplifier output.

Figure 29. Slew Rate, Transient Response, Settling Time, Output Impedance, Overdrive Recovery, V_{OUT} Swing, and Turn-On/Turn-Off Test Circuit

Common-Mode and Power-Supply Rejection

The circuit shown in Figure 30 is used to measure the CMRR. The signal from the network analyzer is applied common-mode to the input. Figure 31 is used to measure the PSRR of V_{S+} and V_{S-} . The power supply under test is applied to the network analyzer dc offset input. For both CMRR and PSRR, the output is probed using a Tektronix high-impedance differential probe across the 953- Ω resistor and referred to the amplifier output by adding back the 0.42-dB as a result of the voltage divider on the output. For these tests, the resistors are matched for best results.

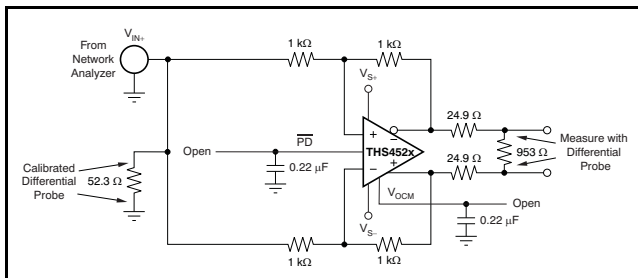

Figure 30. CMRR Test Circuit

Figure 31. PSRR Test Circuit

V_{OCM} Input

The circuit illustrated in Figure 32 is used to measure the frequency response and input impedance of the V_{OCM} input. Frequency response is measured using a Tektronix high-impedance differential probe, with $R_{CM} = 0 \Omega$ at the common point of V_{OUT+} and V_{OUT-} , formed at the summing junction of the two matched 499- Ω resistors, with respect to ground. The input impedance is measured using a Tektronix high-impedance differential probe at the V_{OCM} input with $R_{CM} = 10 \text{ k}\Omega$ and the drop across the 10-k Ω resistor is used to calculate the impedance seen looking into the amplifier V_{OCM} input.

The circuit shown in Figure 33 measures the transient response and slew rate of the V_{OCM} input. A 1-V step input is applied to the V_{OCM} input and the output is measured using a 50- Ω oscilloscope input referenced back to the amplifier output.

Figure 32. V_{OCM} Input Test Circuit

Figure 33. V_{OCM} Transient Response and Slew Rate Test Circuit

APPLICATION INFORMATION

The following circuits show application information for the THS4521. For simplicity, power-supply decoupling capacitors are not shown in these diagrams; see the [EVM and Layout Recommendations](#) section for suggested guidelines. For more details on the use and operation of fully differential op amps, refer to the Application Report [Fully-Differential Amplifiers \(SLOA054\)](#), available for download from the TI web site at www.ti.com.

Differential Input to Differential Output Amplifier

The THS4521 is fully-differential operational amplifiers that can be used to amplify differential input signals to differential output signals. [Figure 34](#) shows a basic block diagram of the circuit (V_{OCM} and PD inputs not shown). The gain of the circuit is set by R_F divided by R_G .

Figure 34. Differential Input to Differential Output Amplifier

Single-Ended Input to Differential Output Amplifier

The THS4521 can also amplify and convert single-ended input signals to differential output signals. [Figure 35](#) illustrates a basic block diagram of the circuit (V_{OCM} and PD inputs not shown). The gain of the circuit is again set by R_F divided by R_G .

Figure 35. Single-Ended Input to Differential Output Amplifier

Input Common-Mode Voltage Range

The input common-mode voltage of a fully-differential op amp is the voltage at the + and – input pins of the device.

It is important to not violate the input common-mode voltage range (V_{ICR}) of the op amp. Assuming the op amp is in linear operation, the voltage across the input pins is only a few millivolts at most. Therefore, finding the voltage at one input pin determines the input common-mode voltage of the op amp.

Treating the negative input as a summing node, the voltage is given by [Equation 1](#):

$$\left(V_{OUT+} \times \frac{R_G}{R_G + R_F} \right) + \left(V_{IN-} \times \frac{R_F}{R_G + R_F} \right) \quad (1)$$

To determine the V_{ICR} of the op amp, the voltage at the negative input is evaluated at the extremes of V_{OUT+} . As the gain of the op amp increases, the input common-mode voltage becomes closer and closer to the input common-mode voltage of the source.

Setting the Output Common-Mode Voltage

The output common-mode voltage is set by the voltage at the V_{OCM} pin. The internal common-mode control circuit maintains the output common-mode voltage within 5-mV offset (typ) from the set voltage. If left unconnected, the common-mode set point is set to midsupply by internal circuitry, which may be overdriven from an external source.

Figure 36 represents the V_{OCM} input. The internal V_{OCM} circuit has typically 23 MHz of -3 dB bandwidth, which is required for best performance, but it is intended to be a dc bias input pin. A $0.22\text{-}\mu\text{F}$ bypass capacitor is recommended on this pin to reduce noise. The external current required to overdrive the internal resistor divider is given approximately by the formula in Equation 2:

$$I_{EXT} = \frac{2V_{OCM} - (V_{S+} - V_{S-})}{50\text{ k}\Omega}$$

where:

- V_{OCM} is the voltage applied to the V_{OCM} pin (2)

Figure 36. V_{OCM} Input Circuit

Typical Performance Variation with Supply Voltage

The THS4521 provides excellent performance across the specified power-supply range of 2.5 V to 3.3 V with only minor variations. The input and output voltage compliance ranges track with the power supply in nearly a 1:1 correlation. Other changes can be observed in slew rate, output current drive, open-loop gain, bandwidth, and distortion.

Single-Supply Operation

To facilitate testing with common lab equipment, the THS4521EVM allows for split-supply operation; most of the characterization data presented in this data sheet is measured using split-supply power inputs. The device can easily be used with a single-supply power input without degrading performance.

Figure 37 shows a dc-coupled single-supply circuit with single-ended inputs. This circuit can also be applied to differential input sources.

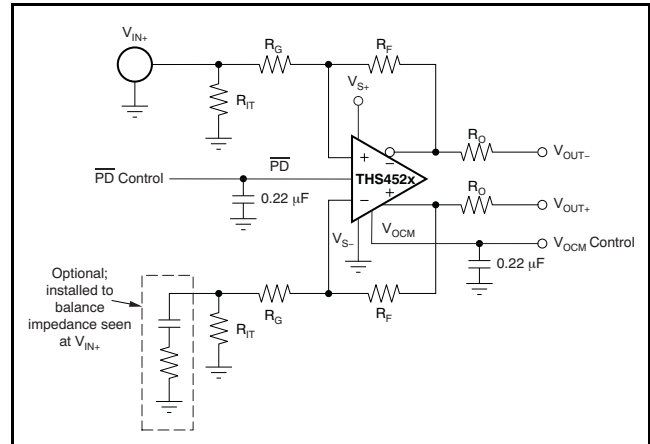

Figure 37. THS4521 DC-Coupled Single-Supply with Single-Ended Inputs

The input common-mode voltage range of the THS4521 is designed to include the negative supply voltage. In the circuit shown in Figure 37, the signal source is referenced to ground. V_{OCM} is set by an external control source or, if left unconnected, the internal circuit defaults to midsupply. Together with the input impedance of the amplifier circuit, R_{FT} provides input termination, which is also referenced to ground.

Note that R_{FT} and optional matching components are added to the alternate input to balance the impedance at signal input.

Low-Power Applications and the Effects of Resistor Values on Bandwidth

For low-power operation, it may be necessary to increase the gain setting resistors values to limit current consumption and not load the source. Using larger value resistors lowers the bandwidth of the THS4521 as a result of the interactions between the resistors, the device parasitic capacitance, and printed circuit board (PCB) parasitic capacitance.

Figure 38. THS4521 Frequency Response with Various Gain Setting and Load Resistor Values

Driving Capacitive Loads

The THS4521 is designed for a nominal capacitive load of 1 pF on each output to ground. When driving capacitive loads greater than 1 pF, it is recommended to use small resistors (R_O) in series with the output, placed as close to the device as possible. Without R_O , capacitance on the output interacts with the output impedance of the amplifier and causes phase shift in the loop gain of the amplifier that reduces the phase margin. This reduction in phase margin results in frequency response peaking; overshoot, undershoot, and/or ringing when a step or square-wave signal is applied; and may lead to instability or oscillation. Inserting R_O isolates the phase shift from the loop gain path and restores the phase margin, but it also limits bandwidth.

LAYOUT RECOMMENDATIONS

It is recommended to follow the layout of the external components near to the amplifier, ground plane construction, and power routing as closely as possible. Follow these general guidelines:

1. Signal routing should be direct and as short as possible into and out of the op amp circuit.
2. The feedback path should be short and direct.
3. Ground or power planes should be removed from directly under the amplifier input and output pins.
4. An output resistor is recommended in each output lead, placed as near to the output pins as possible.
5. Two 0.1- μ F power-supply decoupling capacitors should be placed as near to the power-supply pins as possible.
6. Two 10- μ F power-supply decoupling capacitors should be placed within 1 inch of the device and can be shared among multiple analog devices.
7. A 0.22- μ F capacitor should be placed between the V_{OCM} input pin and ground near to the pin. This capacitor limits noise coupled into the pin.
8. The \overline{PD} pin uses TTL logic levels; a bypass capacitor is not necessary if actively driven, but can be used for robustness in noisy environments whether driven or not.

PACKAGING INFORMATION

THS4521SKGD1	ACTIVE	XCEPT	KGD	0	360	TBD	Call TI	N / A for Pkg Type	

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
