

NB7L216

2.5 V / 3.3 V, 12Gb/s Multi Level Clock/Data Input to RSECL, High Gain Receiver/Buffer/Translator with Internal Termination

Description

The NB7L216 is a differential receiver/driver with high gain output targeted for high frequency applications. The device is functionally equivalent to the NBSG16 but with much higher gain output. This highly versatile device provides 35 dB of gain up to 7 GHz.

Inputs incorporate internal 50 Ω termination resistors and accept Negative ECL (NECL), Positive ECL (PECL), LVTTTL, LVCMOS, CML, or LVDS. Outputs are Reduced Swing ECL (RSECL), 400 mV.

The V_{BB} pin is an internally generated voltage supply available to this device only. V_{BB} is used as a reference voltage for single-ended NECL or PECL inputs. For all single-ended input conditions, the unused complementary differential input should be connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} output should be left open.

Application notes, models and support documentation are available at www.onsemi.com.

APPLICATION INFORMATION

All NB7L216 inputs can accept PECL, CML, LVTTTL, LVCMOS and LVDS signal levels. The limitations for differential input signal (LVDS, PECL, or CML) are minimum input swing of 75 mV and the maximum input swing of 2500 mV. Within these conditions, the input voltage can range from V_{CC} to 1.2 V. Examples interfaces are illustrated below in a 50 Ω environment ($Z = 50 \Omega$). For output termination and interface, refer to application note [AND8020/D](#).

Table 7. INTERFACING OPTIONS

Interfacing Options	Connections
CML	Connect VTD and $\overline{VTD}$ to V_{CC} (See Figure 18)
LVDS	Connect VTD and $\overline{VTD}$ Together (See Figure 20)
AC-COUPLED	Bias VTD and $\overline{VTD}$ Inputs within Common Mode Range (V_{CMR}) (See Figure 19)
RSECL, PECL, NECL	Standard ECL Termination Techniques (See Figure 13)
LVTTTL, LVCMOS	An External Voltage (V_{THR}) should be Applied to the Unused Complementary Differential Input. Nominal V_{THR} is 1.5 V for LVTTTL and $V_{CC} / 2$ for LVCMOS Inputs. This Voltage must be within the V_{THR} Specification (See Figure 21)
