## ■ SPECIAL CONSIDERATIONS

In applications where separate power sources are used to drive  $V_{DD}$  and the signal input, the  $V_{DD}$  current capability should exceed  $V_{DD}/R_L$  ( $R_L$ =effective external load of the UTC 4066 bilateral switches). This provision avoids any permanent current flow or clamp action of the  $V_{DD}$  supply when power is applied or removed from UTC 4066.

In certain applications, the external load-resistor current may include both  $V_{DD}$  and Signal-line components. To avoid drawing  $V_{DD}$  current when switch current flows into terminals 1,4,8 or 11, the voltage drop across the bidirectional switch must not exceed 0.6V at  $T_A \leq 25^\circ\text{C}$ , or 0.4V at  $T_A > 25^\circ\text{C}$  (calculated from  $R_{ON}$  values shown).

NO  $V_{DD}$  current will flow through  $R_L$  if the switch current flows into terminals 2, 3, 9 or 10.
