**Note:** Since the built-in LED doesn't contain any limiting resistors, externally connect limiting resistors within the limits shown in the above table.

# Dimensions

Note: All units are in millimeters unless otherwise indicated. Unless otherwise specified, a tolerance of  $\pm 0.4$  mm applies to all dimensions.

## Types with no LED B3J-1□00

## 1 LED Types B3J-2□00, -3□00, -4□00

## 2 LED Types B3J-5□00, -6□00, -7□00

# Precautions

- Do not apply additional force to the plunger once it has stopped moving.
- Solder at 260°±5°C within five seconds and within two tries.
- The Switches are not sealed and must be protected with a resin sheet as shown below when used in dust-prone environments.
- Do not wash the Switches. The Switches may be damaged by solvents if either wiped off using solvents or immersed in solvents.
- Do not allow flux or flux foam to penetrate onto the component side of the PCB.
- Use a single-sided PCB with a thickness of 1.6 mm. The Switches may be damaged due to instability or heat from soldering if other PCBs (other thickness or through holes) are used. If it is necessary to use another PCB, test the compatibility and processing in advance.

## Indicators

- Connect a limiting resistor to the indicator. Since the Switch does not contain any limiting resistor, obtain a limiting resistance according to the following formula depending on the voltage to be used so as to satisfy indicator characteristics.

$$\text{Limiting resistance [R]} = \frac{\text{Voltage used [V]} - \text{Indicator forward voltage [V}_F\text{]}}{\text{Indicator forward current [I}_F\text{]}} \quad (\Omega)$$
