

## General Description

The TD9516/TD9517/TD9518/TD9519 series of power switches are designed for USB applications. The 62mΩ N-channel MOSFET power switch satisfies the voltage drop requirements of USB specification. The protection features include current-limit protection, short-circuit protection, and over-temperature protection. The device limits the output current at current limit threshold level. When  $V_{OUT}$  drops below 1.5V, the devices limit the current to a lower and safe level. The over-temperature protection limits the junction temperature below 140°C in case of short circuit or over load conditions. Other features include a deglitched OCB output to indicate the fault condition and an enable input to enable or disable the device.

## Features

- 62mΩ High Side MOSFET
- Wide Supply Voltage Range: 2.7V to 5.5V
- Current-Limit and Short-Circuit Protections
- Over-Temperature Protection
- Fault Indication Output
- Enable Input
- Lead Free and Green Devices Available

## Applications

- Notebook and Desktop Computers
- USB Ports
- High-Side Power Protection Switches

## Pin Description

| Pin Number        |                   | Pin Name | Description                                                                                                                                                |
|-------------------|-------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TD9516/<br>TD9517 | TD9518/<br>TD9519 |          |                                                                                                                                                            |
| 1                 | 5                 | VOUT     | Output Voltage Pin. The output voltage follows the input voltage. When ENB is high or EN is low, the output voltage is discharged by an internal resistor. |
| 2                 | 2                 | GND      | Ground.                                                                                                                                                    |
| 3                 | 1                 | OCB      | Fault Indication Pin. This pin goes low when a current limit or an over-temperature condition is detected after a 12ms deglitch time.                      |
| 4                 | 3                 | EN       | Enable Input. Pulling this pin to high will enable the device and pulling this pin to low will disable device. The EN pin cannot be left floating.         |
|                   |                   | ENB      | Enable Input. Pulling this pin to high will enable the device and pulling this pin to low will disable device. The EN pin cannot be left floating.         |
| 5                 | 4                 | VIN      | Power Supply Input. Connect this pin to external DC supply.                                                                                                |

## Functional Block Diagram

## Absolute Maximum Ratings

| Symbol            | Parameter                                 | Rating    | Unit |
|-------------------|-------------------------------------------|-----------|------|
| $V_{IN}$          | $V_{IN}$ Input Voltage ( $V_{IN}$ to GND) | -0.3 ~ 7  | V    |
| $V_{OUT}$         | $V_{OUT}$ to GND Voltage                  | -0.3 ~ 7  | V    |
| $V_{ENB}, V_{EN}$ | EN, ENB to GND Voltage                    | -0.3 ~ 7  | V    |
| $V_{OCB}$         | OCB to GND Voltage                        | -0.3 ~ 7  | V    |
| $T_J$             | Maximum Junction Temperature              | 150       | °C   |
| $T_{STG}$         | Storage Temperature                       | -65 ~ 150 | °C   |
| $T_{SDR}$         | Maximum Soldering Temperature, 10 Seconds | 260       | °C   |

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Recommended Operating Conditions

| Symbol           | Parameter                          | Range     | Unit |
|------------------|------------------------------------|-----------|------|
| V <sub>IN</sub>  | VIN Input Voltage                  | 2.7~5.5   | V    |
| VCC              | VCC Supply Voltage                 | 4.5 ~ 5.5 | V    |
| I <sub>OUT</sub> | OUT Output Current (TD9516/TD9518) | 0~1       | A    |
|                  | OUT Output Current (TD9517/TD9519) | 0~ 2.4    | A    |
| T <sub>A</sub>   | Ambient Temperature                | -40 ~ 85  | °C   |
| T <sub>J</sub>   | Junction Temperature               | -40 ~ 125 | °C   |

Note: Refer to the typical application circuit.

## Thermal Characteristics

| Symbol          | Parameter                                  | Typical Value | Unit |
|-----------------|--------------------------------------------|---------------|------|
| θ <sub>JA</sub> | Junction-to-Ambient Resistance in Free Air | 235           | °C/W |

## Electrical Characteristics

Unless otherwise specified, these specifications apply over  $V_{IN}=5V$ ,  $V_{EN}=5V$  or  $V_{ENB}=0V$  and  $T_A=-40 \sim 85$  °C. Typical values are at  $T_A=25$  °C.

| Symbol                                      | Parameter                    | Test Conditions                                 |      |      |      | Unit |
|---------------------------------------------|------------------------------|-------------------------------------------------|------|------|------|------|

CH1:  $V_{IN}$ , 2V/Div, DC

CH2:  $V_{OUT}$ , 2V/Div, DC

CH3:  $I_{OUT}$ , 5A/Div, DC

TIME: 50μs/Div

#### Load Transient Response

TD9517A,  $V_{IN}=5V$ ,  $R_{LOAD}=1k\Omega$  to  $2.2\Omega$ ,

$C_{IN}=C_{OUT}=33\mu F$ /Electrolytic

CH1:  $V_{OUT}$ , 1V/Div, DC

CH2:  $I_{OUT}$ , 1A/Div, DC

TIME: 1ms/Div

## Type Application Circuit

## Function Description

### VIN Under-Voltage Lockout (UVLO)

The TD951X series of power switches have a built-in under-voltage lockout circuit to keep the output shutting off until internal circuitry is operating properly. The UVLO circuit has hysteresis and a de-glitch feature so that it will typically ignore undershoot transients on the input. When input voltage exceeds the UVLO threshold, the output voltage starts a soft-start to reduce the inrush current.

### Power Switch

The power switch is an N-channel MOSFET with a low  $R_{DS(ON)}$ . The internal power MOSFET does not have the body diode. When IC is off, the MOSFET prevents a current flowing from the VOUT back to VIN and VIN to VOUT.

### Current-Limit Protection

The TD951X series of power switches provide the current-limit protection function. During current-limit, the devices limit output current at current limit threshold. For reliable operation, the device should not be operated in current-limit for extended period.

### Short-Circuit Protection

When the output voltage drops below 1.5V, which is caused by an over-load or a short-circuit, the devices limit the output current down to a safe level. The short-circuit current limit is used to reduce the power dissipation during short-circuit conditions. If the junction temperature reaches over-temperature threshold, the device will enter the thermal shutdown.

### OCB Output

The TD951X series of power switches provide an open-drain output to indicate that a fault has occurred. When any of current-limit or over-temperature protection occurs for a deglitch time of  $t_{D(OCB)}$ , the OCB goes low. Since the OCB pin is an open-drain output, connecting a resistor to a pull high voltage is necessary.

### Enable/Disable

Pull the ENB above 2V or EN below 0.8V will disable the device, and pull ENB pin below 0.8V or EN above 2V will enable the device. When the IC is disabled, the supply current is reduced to less than 1μA. The enable input is compatible with both TTL and CMOS logic levels. The EN/ENB pin cannot be left floating.

### Over-Temperature Protection

When the junction temperature exceeds 140°C, the internal thermal sense circuit turns off the power FET and allows the device to cool down. When the device's junction temperature cools by 20°C, the internal thermal sense circuit will enable the device, resulting in a pulsed output during continuous thermal protection. Thermal protection is designed to protect the IC in the event of over temperature conditions. For normal operation, the junction temperature cannot exceed  $T_J = +125^\circ\text{C}$ .

## Application Information

### Input Capacitor

A 1 $\mu$ F ceramic bypass capacitor from  $V_{IN}$  to GND, located near the TD951X, is strongly recommended to suppress the ringing during short circuit fault event. Without the bypass capacitor, the output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

### Output Capacitor

A low-ESR 10 $\mu$ F aluminum electrolytic or tantalum between  $V_{OUT}$  and GND is strongly recommended to reduce the voltage drop during hot-attachment of downstream peripheral. (Per USB 2.0, output ports must have a minimum 120 $\mu$ F of low-ESR bulk capacitance per hub).

Higher-value output capacitor is better when the output load is heavy. Additionally, bypassing the output with a 0.1 $\mu$ F ceramic capacitor improves the immunity of the device to short-circuit transients.

### Layout Consideration

The PCB layout should be carefully performed to maximize thermal dissipation and to minimize voltage drop, droop and EMI. The following guidelines must be considered:

1. Please place the input capacitors near the VIN pin as close as possible.
2. Output decoupling capacitors for load must be placed near the load as close as possible for decoupling highfrequency ripples.
3. Locate TD951X and output capacitors near the load to reduce parasitic resistance and inductance for excellent load transient performance.
4. The negative pins of the input and output capacitors and the GND pin must be connected to the ground plane of the load.
5. Keep  $V_{IN}$  and  $V_{OUT}$  traces as wide and short as possible.
