General Description

TriQuint's TGA2312-FL is a high power amplifier operating between 9 and 10 GHz and typically providing 48dBm of saturated output power, 38% power-added efficiency and 13dB small signal gain.

Ideally suited for marine and weather radar, the TGA2312-FL is packaged in a CuW-base, flanged package for superior thermal management.

The TGA2312-FL uses TriQuint's 0.25um GaN on SiC technology which provides superior performance while maintaining high reliability. In addition, the use of SiC substrates provides optimum thermal performance necessary for reliable high power operation.

Lead-free and RoHS compliant.

Evaluation Boards are available upon request.

Application Circuit

**Note 1: One of these caps can be removed for drain pulsing.
Drain voltage can be applied to either Vd pins.**

Notes: To prevent damage to the device due to overshoot or oscillation issues, TriQuint recommends that current limits for all power supplies are set properly for each power supply before applying the voltage. The following are recommended current limits for each power supply:

- Set 50 mA current limit to V_G .
- Set 8 A current limit to V_D .

Bias-up Procedure

1. Apply -5.0 V to V_G .
2. Apply +24 V to V_D .
3. Adjust V_G until $I_{DQ} = 2400$ mA ($V_G \sim -2.6$ V Typ.)
4. Turn on RF supply.

Bias-down Procedure

1. Turn off RF supply.
2. Reduce V_G to -5.0 V. Ensure $I_{DQ} \sim 0$ mA.
3. Set V_D to 0 V.
4. Set V_G to 0 V.
