

## Automotive-Grade, Galvanically Isolated Current Sensor IC with Common-Mode Field Rejection and Overcurrent Detection in Small Footprint Low-Profile Packages

### FEATURES AND BENEFITS

- AEC-Q100 automotive qualified
- Differential Hall sensing rejects common-mode fields
- Integrated shield virtually eliminates capacitive coupling from current conductor to die, greatly suppressing output noise due to high dv/dt transients
- Industry-leading noise performance with greatly improved bandwidth through proprietary amplifier and filter design techniques
- High bandwidth 120 kHz analog output for faster response times in control applications
- Patented integrated digital temperature compensation circuitry allows for near closed-loop accuracy over temperature in an open loop sensor
- Single supply operation with nonratiometric output at 3.3 and 5 V options
- Overcurrent  $\overline{\text{FAULT}}$  available between 50% and 200%  $I_P$  with 1.5  $\mu\text{s}$  (typ) response time
- Non-ratiometric output provides immunity to noisy supplies
- Small footprint QFN-12 with wettable flank and SOIC-8 suitable for space-constrained automotive applications
- 0.6 m $\Omega$  (QFN-12) or 1.2 m $\Omega$  (SOIC-8) primary conductor resistance for low power loss and high inrush current withstand capability
- UL certified package (SOIC-8 only) for voltage isolation

### PACKAGES:

12-contact QFN with wettable flank  
3 mm × 3 mm × 0.75 mm  
(EXB package)

8-pin SOIC  
with internally fused path  
(LCB package)

Not to scale

### DESCRIPTION

The Allegro™ ACS71240 current sensor IC is an economical and precise solution for AC or DC current sensing in industrial, automotive, commercial, and communications applications.

The device consists of a precise, low-offset linear Hall sensor circuit with a copper conduction path located near the surface of the die. Applied current flowing through this copper path generates a magnetic field which is sensed by the integrated Hall IC and converted into a proportional voltage. The resistance of the integrated conductor is far less than typical sense resistors, which reduces power loss and improves efficiency.

Rejection of external common-mode magnetic fields is achieved through differential sensing, enabling high accuracy in magnetically noisy environments. A precise voltage proportional to the measured current is generated by the low-offset, chopper-stabilized Hall front end.

Zero ampere output voltage and device sensitivity are programmed at the Allegro factory to provide a high accuracy solution across the full automotive temperature range.

The ACS71240 includes an integrated fault comparator for simplified overcurrent detection. The ultrafast response time provides the system with ample time to detect and protect against short-circuit events.

The ACS71240 is provided in small, low-profile surface-mount package options: QFN-12 with wettable flank and SOIC-8. The leadframe is plated with 100% matte tin, which is compatible with standard lead (Pb) free printed circuit board assembly processes. Internally, the device is Pb-free, except for flip-chip high-temperature Pb-based solder balls, currently exempt from RoHS. The device is fully calibrated prior to shipment from the factory.

## ABSOLUTE MAXIMUM RATINGS

Characteristic	Symbol	Notes	Rating	Units
Supply Voltage	$V_{CC}$		6	V
Reverse Supply Voltage	$V_{CC(R)}$		-0.5	V
Output Voltage	$V_{IOUT}$		$V_{CC} + 0.7$	V
Reverse Output Voltage	$V_{IOUT(R)}$		-0.5	V
FAULT Voltage	$V_{FAULT}$		25	V
Reverse FAULT Voltage	$V_{FAULT(R)}$		-0.5	V
Operating Ambient Temperature Range	$T_A$	Range K (QFN-12 package)	-40 to 125	°C
		Range L (SOIC-8 package)	-40 to 150	°C
Junction Temperature	$T_{J(MAX)}$		165	°C
Storage Temperature Range	$T_{stg}$		-65 to 170	°C

## ISOLATION CHARACTERISTICS (for SOIC-8 package only)

Characteristic	Symbol	Notes	Value	Units
Dielectric Surge Strength Test Voltage	$V_{SURGE}$	Tested $\pm 5$ pulses at 2/minute in compliance to IEC 61000-4-5 1.2 $\mu$ s (rise) / 50 $\mu$ s (width).	6000	V
Dielectric Strength Test Voltage	$V_{ISO}$	Agency type-tested for 60 seconds per UL 60950-1 (edition 2); production-tested at $V_{ISO}$ for 1 second, in accordance with UL 60950-1 (edition 2)	2400	$V_{RMS}$
Working Voltage for Basic Isolation	$V_{WVBI}$	Maximum approved working voltage for basic (single) isolation according to UL 60950-1 (edition 2)	420	$V_{PK}$ or $V_{DC}$
			297	$V_{RMS}$
Clearance	$D_{cl}$	Minimum distance through air from IP leads to signal leads	4.2	mm
Creepage	$D_{cr}$	Minimum distance along package body from IP leads to signal leads	4.2	mm

## ISOLATION CHARACTERISTICS (for QFN-12 package only)

Characteristic	Symbol	Notes	Value	Units
Working Voltage for Basic Isolation <sup>[1]</sup>	$V_{WVBI}$	Voltage applied between pins 1-4 and 5-12	100	$V_{PK}$ or $V_{DC}$

<sup>[1]</sup> Based on characterization. No agency testing was conducted.

## PINOUT DIAGRAMS AND TERMINAL LIST TABLES

**Package EX, 12-Pin QFN  
Pinout Diagram**

**Terminal List Table (QFN-12)**

Number	Name	Description
1, 2	IP+	Positive terminals for current being sensed; fused internally
3, 4	IP–	Negative terminals for current being sensed; fused internally
5	GND	Signal ground terminal
6	FAULT	Overcurrent fault; active low
7, 8, 9, 10	NC	No connection; connect to ground for optimal ESD performance
11	VIOUT	Analog output signal
12	VCC	Device power supply terminal

**Package LC, 8-Pin SOIC  
Pinout Diagram**

**Terminal List Table (SOIC-8)**

Number	Name	Description
1, 2	IP+	Positive terminals for current being sensed; fused internally
3, 4	IP–	Negative terminals for current being sensed; fused internally
5	GND	Signal ground terminal
6	FAULT	Overcurrent fault; active low
7	VIOUT	Analog output signal
8	VCC	Device power supply terminal

## Automotive-Grade, Galvanically Isolated Current Sensor IC with Common-Mode Field Rejection and Overcurrent Detection in Small Footprint Low-Profile Packages

**COMMON ELECTRICAL CHARACTERISTICS (continued):** Valid through the full range of  $T_A$  and  $V_{CC}$ , unless otherwise specified

Characteristic	Symbol	Test Conditions	Min.	Typ. [1]	Max.	Unit
<b>FAULT CHARACTERISTICS</b>						
$\overline{\text{FAULT}}$ Operating Point	$I_{\overline{\text{FAULT}}}$		–	$\pm 1 \times I_{PR}^{[4]}$	–	A
$\overline{\text{FAULT}}$ Current Hysteresis	$I_{F(HYS)}$	Percent of $I_{PR(MAX)}$	3	5	–	%
$\overline{\text{FAULT}}$ Output Pullup Resistor	$R_{PU}$		10	–	500	k $\Omega$
$\overline{\text{FAULT}}$ Output Voltage	$V_{OL}$	$R_{PU} = 10 \text{ k}\Omega$ , during fault condition	–	–	0.3	V
$\overline{\text{FAULT}}$ Response Time	$t_{\overline{\text{FAULT}}}$	Time from $ I_P $ rising above $ I_{\overline{\text{FAULT}}} $ until $V_{\overline{\text{FAULT}}} < V_{OL(MAX)} - 100 \text{ pF}$ from $\overline{\text{FAULT}}$ to GND. Input current step 20% above $I_{\overline{\text{FAULT}}}$ with rise time $\leq 1 \mu\text{s}$ .	–	1.5	2.5 [5]	$\mu\text{s}$
$\overline{\text{FAULT}}$ Error	$E_F$	$I_{\overline{\text{FAULT}}}$ , $T_A = 25^\circ\text{C}$	–10	$\pm 3.5$	10	%
		$T_A = -40^\circ\text{C}$ or $T_{A(MAX)}$	–10	$\pm 5$	10	%

[1] Typical values with  $\pm$  are 3 sigma values.

[2] Guaranteed by design. Limit calculated using 6 sigma. Not tested in production.

[3] The sensor IC will continue to respond to current beyond the range of  $I_P$  until the high or low saturation voltage; however, the nonlinearity in this region will be worse than through the rest of the measurement range.

[4] Unless otherwise specified, contact Allegro for alternative fault levels. Available from  $\pm 0.5$  to  $2 \times I_{PR}$ .

[5] Not tested in production.

ACCURACY PERFORMANCE						
Total Output Error [2]	E <sub>TOT</sub>	I <sub>P</sub> = 10 A, T <sub>A</sub> = 25°C to 125°C	−2.5	±1.4	2.5	%
		I <sub>P</sub> = 10 A, T <sub>A</sub> = −40°C to 25°C	−6	±1.8	6	%
TOTAL OUTPUT ERROR COMPONENTS [3] E <sub>TOT</sub> = E <sub>SENS</sub> + 100 × V <sub>OE</sub> / (Sens × I <sub>P</sub> )						
Sensitivity Error	E <sub>SENS</sub>	I <sub>P</sub> = 10 A, T <sub>A</sub> = 25°C to 125°C	−2	±1.1	2	%
		I <sub>P</sub> = 10 A, T <sub>A</sub> = −40°C to 25°C	−5.5	±1.7	5.5	%
Offset Voltage Error	V <sub>OE</sub>	I <sub>P</sub> = 0 A, T <sub>A</sub> = 25°C to 125°C	−15	±9.7	15	mV
		I <sub>P</sub> = 0 A, T <sub>A</sub> = −40°C to 25°C	−30	±8.5	30	mV
ACCURACY PERFORMANCE INCLUDING LIFETIME DRIFT [4]						
Total Output Error Including Lifetime Drift [5]	E <sub>TOT_drift</sub>	I <sub>P</sub> = 10 A, T <sub>A</sub> = 25°C to 125°C	−5.7	±1.8	5.7	%
		I <sub>P</sub> = 10 A, T <sub>A</sub> = −40°C to 25°C	−6	±1.5	6	%
Sensitivity Error Including Lifetime Drift [6]	E <sub>SENS_drift</sub>	I <sub>P</sub> = 10 A, T <sub>A</sub> = 25°C to 125°C	−5.1	±1.2	5.1	%
		I <sub>P</sub> = 10 A, T <sub>A</sub> = −40°C to 25°C	−5.6	±1.2	5.6	%
Offset Voltage Error Including Lifetime Drift [7]	V <sub>OE_drift</sub>	I <sub>P</sub> = 0 A, T <sub>A</sub> = 25°C to 125°C	−28	±4.5	28	mV
		I <sub>P</sub> = 0 A, T <sub>A</sub> = −40°C to 25°C	−30	±4.3	30	mV

[1] Typical values with  $\pm$  are 3 sigma values, except for lifetime drift, which are the average value including drift (from the worst case stress) after AEC-Q100 qualification.

[2] Percentage of  $I_P$ .

[3] A single device will not have both the maximum/minimum sensitivity error and maximum/minimum offset voltage, as that would violate the maximum/minimum total output error specification.

[4] Lifetime drift characteristics are based on AEC-Q100 qualification results.

[5] All devices stayed within min/max limits throughout AEC-Q100 qualification. The worst drift observed was 6.1%.

[6] All devices stayed within min/max limits throughout AEC-Q100 qualification. The worst drift observed was 4%.

[7] All devices stayed within min/max limits throughout AEC-Q100 qualification. The worst drift observed was 22 mV.

## FUNCTIONAL DESCRIPTION

### Power-On Reset Operation

Power-On Reset (POR) refers to the voltage at which the device effectively turns on. In order to ensure accuracy of readings, the part remains off or “in POR” until the voltage reaches a point at which the device can be trusted. At this point the output leaves high Z and begins reporting the current.

The descriptions in this section assume:  $T_A = 25^\circ\text{C}$ , no output load ( $R_L$ ,  $C_L$ ), and no significant magnetic field is present. Refer to the scope plot in Figure 2 for the intended power on/off profile of the ACS71240. The device tested below contains a pull-down on  $V_{IOUT}$ , forcing the output voltage to 0 V during the high Z portion.

**Figure 2: Power On/Off Profile of ACS71240**  
 $I_{CC}$  = Green,  $V_{IOUT}$  = Red,  $V_{CC}$  = Yellow

### Power-On

As  $V_{CC}$  ramps up, the device output is high impedance (pink section) until  $V_{CC}$  reaches POR.

### Power-Off

As  $V_{CC}$  drops below POR the device output will enter a high impedance state.

## DEFINITIONS OF ACCURACY CHARACTERISTICS

**Sensitivity (Sens).** The change in sensor IC output in response to a 1 A change through the primary conductor. The sensitivity is the product of the magnetic circuit sensitivity (G/A) (1 G = 0.1 mT) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

**Nonlinearity ( $E_{LIN}$ ).** The nonlinearity is a measure of how linear the output of the sensor IC is over the full current measurement range. The nonlinearity is calculated as:

$$E_{LIN} = \left\{ 1 - \left[ \frac{V_{IOUT}(I_{PR(max)}) - V_{IOUT(Q)}}{2 \cdot V_{IOUT}(I_{PR(max)}/2) - V_{IOUT(Q)}} \right] \right\} \cdot 100(\%)$$

**Zero-Current Output Voltage ( $V_{IOUT(Q)}$ ).** The output of the sensor when the primary current is zero. For unipolar devices this value will be 10% of operating voltage, 0.5 V and 0.33 V for 5 V and 3.3 V respectively. For bidirectional devices, the output will be 50% of the operating voltage, 2.5 V and 1.65 V for 5 V and 3.3 V devices respectively. Since the ACS71240 is a non-ratiometric part, these values will be stable over  $V_{CC}$  variations. Variation in  $V_{IOUT(Q)}$  can be attributed to the resolution of the Allegro linear IC quiescent voltage trim and thermal drift.

**Offset Voltage ( $V_{OE}$ ).** The deviation of the device output from its ideal quiescent value due to nonmagnetic causes. To convert this voltage to amperes, divide by the device sensitivity, Sens.

**Total Output Error ( $E_{TOT}$ ).** The difference between the current measurement from the sensor IC and the actual current ( $I_P$ ), relative to the actual current. This is equivalent to the difference between the ideal output voltage and the actual output voltage, divided by the ideal sensitivity, relative to the current flowing through the primary conduction path:

$$E_{TOT}(I_P) = \frac{V_{IOUT\_ideal}(I_P) - V_{IOUT}(I_P)}{Sens_{ideal}(I_P) \cdot I_P} \cdot 100(\%)$$

The Total Output Error incorporates all sources of error and is a function of  $I_P$ . At relatively high currents,  $E_{TOT}$  will be mostly due to sensitivity error, and at relatively low currents,  $E_{TOT}$  will be mostly due to Offset Voltage ( $V_{OE}$ ). In fact, at  $I_P = 0$ ,  $E_{TOT}$  approaches infinity due to the offset. This is illustrated in Figure 3 and Figure 4. Figure 3 shows a distribution of output voltages versus  $I_P$  at 25°C and across temperature. Figure 4 shows the corresponding  $E_{TOT}$  versus  $I_P$ .

**Figure 3: Output Voltage versus Sensed Current**

**Figure 4: Total Output Error versus Sensed Current**

**Power Supply Rejection Ratio (PSRR).** The ratio of the change on  $V_{IOUT}$  to a change in  $V_{CC}$  in dB.

$$PSRR = 20 \log_{10} \left( \left| \frac{\Delta V_{CC}}{\Delta V_{IOUT}} \right| \right)$$

**FAULT Error ( $E_F$ ).** The difference between the current at which the FAULT pin trips ( $I_{FAULT}$ ), relative to the ideal fault current ( $I_{FAULT\_ideal}$ ). This is equivalent to the difference between the ideal fault current and the actual fault current divided by the ideal current, and is defined as:

$$E_F = \frac{I_{FAULT} - I_{FAULT\_ideal}}{I_{FAULT\_ideal}} \times 100 (\%)$$

## Fault Behavior

The ACS71240 is available with both a latched and unlatched  $\overline{\text{FAULT}}$  pin output. Unless otherwise stated, the default operation is unlatched. Contact Allegro for more details.

### Unlatched Fault Behavior

In the event that the  $\overline{\text{FAULT}}$  pin is unlatched, the  $\overline{\text{FAULT}}$  output will only assert while an overcurrent condition is present. When an overcurrent condition occurs, the  $\overline{\text{FAULT}}$  pin will be pulled low within  $\overline{\text{FAULT}}$  response time,  $t_{\text{FAULT}}$ . When the overcurrent condition is removed, another  $t_{\text{FAULT}}$  will delay the release of the line, after which the  $\overline{\text{FAULT}}$  line will return to  $V_{\text{CC}}$  with a time constant based on the pull-up resistor and line capacitance.

Figure 5: Fault trip with response time

### Latched Fault Behavior

In the event that the fault pin is latched, the  $\overline{\text{FAULT}}$  output will assert when an overcurrent condition is present. The  $\overline{\text{FAULT}}$  pin will remain latched even after the overcurrent condition has subsided. The  $\overline{\text{FAULT}}$  pin will remain asserted until the device is power-cycled.

### Fault Filtering

To prevent nuisance tripping while in latched mode, the ACS71240 is available with a variety of minimum fault times, which are the minimum period a fault event must be present before the  $\overline{\text{FAULT}}$  pin will latch. This minimum period,  $t_{\text{PW(MIN)}}$ , may be 0  $\mu\text{s}$ , 0.5  $\mu\text{s}$ , or 1  $\mu\text{s}$ , and is available upon request. Contact Allegro for more details.

In latched mode, there is an additional delay of 1 clock cycle ( $t_{\text{CLK}} < 150 \text{ ns}$ ) after the overcurrent event occurs. The fault behavior for latched and unlatched modes are shown in Figure 6 and Figure 7.

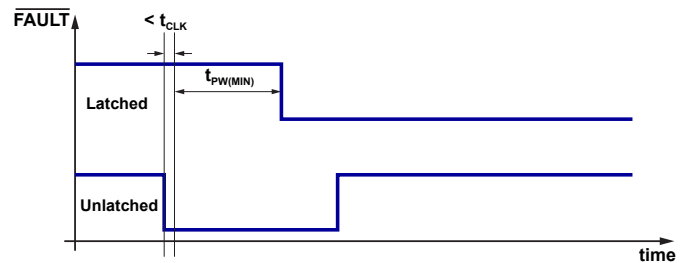

Figure 6: Fault event longer than  $t_{\text{PW(MIN)}}$

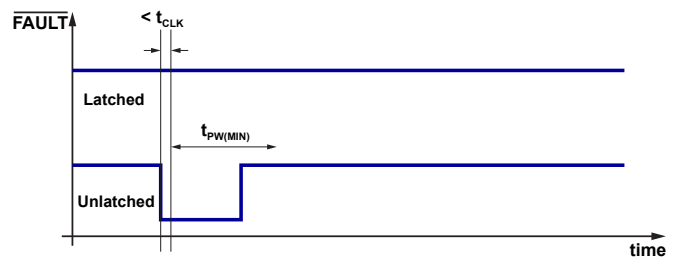

Figure 7: Fault event shorter than  $t_{\text{PW(MIN)}}$

## DEFINITIONS OF DYNAMIC RESPONSE CHARACTERISTICS

**Power-On Time ( $t_{PO}$ ).** When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field. Power-On Time,  $t_{PO}$ , is defined as the time it takes for the output voltage to settle within  $\pm 10\%$  of its steady-state value under an applied magnetic field, after the power supply has reached its minimum specified operating voltage,  $V_{CC(min)}$ , as shown in the chart at right.

Figure 8: Power-On Time ( $t_{PO}$ )

**Rise Time ( $t_r$ ).** The time interval between a) when the sensor reaches 10% of its full-scale value, and b) when it reaches 90% of its full-scale value.

Figure 9: Rise Time ( $t_r$ ) and Propagation Delay ( $t_{pd}$ )

**Response Time ( $t_{RESPONSE}$ ).** The time interval between a) when the sensed input current reaches 90% of its final value, and b) when the sensor output reaches 90% of its full-scale value.

Figure 10: Response Time ( $t_{RESPONSE}$ )

## **Common-Mode Field Rejection**

The ACS71240 features two Hall-effect sensors used differentially in order to eliminate stray field. The two sensors are placed on opposite sides of the current loop. This allows the common magnetic field to be determined and removed before the signal is sent to the end user. Despite this common field rejection, it is always best practice to reduce the amount of stray fields around the current sensor as much as possible. See the Allegro Applications note on reducing common mode field for more details.

## PACKAGE OUTLINE DRAWINGS
