

Helping Customers Innovate, Improve & Grow

FX-700

Description

The FX-700 is a crystal-based frequency translator used in communications applications where low jitter is paramount. Performance advantages include superior jitter performance, high output frequencies and small package size. Advanced custom ASIC technology results in a highly robust, reliable and predictable device. The device is packaged in a 16 pad ceramic package with a hermetic seam welded lid.

Features

- 5.0 x 7.5 mm, Hermetically sealed SMD package
- Frequency Translation to 77.760 MHz
- 3.3 Volt or 5.0 Volt Supply
- Tri-State Output allows board test
- Lock Detect
- Commercial or Industrial Temp. Range
- CMOS Output
- Absolute Pull Range Performance to +/-100 ppm
- Capable of locking to an 8 kHz pulse/BITS clock
- Product is free of lead and compliant to EC RoHS Directive 

Applications

- Frequency Translation, Clock Smoothing
- Telecom - SONET/SDH/ATM
- Datacom - DSLAM, DSLAR, Access Nodes
- Base Station - GSM, CDMA
- Cable Modem Head End

Performance Specifications

| Table 1. Electrical Performance | | | | | |
|---|-----------|--------------------|---------|--------------------|--------|
| Parameter | Symbol | Min | Typical | Maximum | Units |
| Frequency ⁴ | | | | | |
| Input Frequency | F_{IN} | 0.001 | | 77.76 | MHz |
| Output Frequency | F_{OUT} | 0.1 | | 80.0 | MHz |
| Capture Range (ordering option) | APR | ±50, ±80, or ±100 | | | ppm |
| Supply Voltage ¹ (V_{DD} , V_{DB} , V_{DA} , V_{DO}) | V_{DD} | 4.5 | 5.0 | 5.5 | V |
| | V_{DD} | 2.97 | 3.3 | 3.63 | V |
| Current ⁵ | I_{DD} | | | 40 | mA |
| Input | | | | | |
| Input High Voltage | V_{IH} | $0.7 \cdot V_{DD}$ | | | V |
| Input Low Voltage | V_{IL} | | | $0.3 \cdot V_{DD}$ | V |
| Output | | | | | |
| Output High Voltage | V_{OH} | $0.9 \cdot V_{DD}$ | | | V |
| Output Low Voltage | V_{OL} | | | $0.1 \cdot V_{DD}$ | V |
| Output | | | | | |
| Rise Time ² | t_R | | | 3.0 | ns |
| Fall Time ² | t_F | | | 3.0 | ns |
| Duty Cycle ³ | SYM | 40 | 50 | 60 | % |
| Jitter Generation - 80.0MHz output | Φ_J | | 4.7 | | ps-rms |
| Operating Temp (ordering option) | T_{OP} | 0/70, -40/85 | | | °C |

1. A 0.01uF high frequency ceramic capacitor in parallel with a 0.1uF low frequency tantalum bypass capacitor is recommended
2. Figure 2 defines the waveform parameters. Figure 3 illustrates the standard test conditions under which these parameters are tested and specified.
3. Duty Cycle is defined as (on time/period) with $V_s = V_{dd}/2$ per Figure 2. Duty Cycle is measured with a 15pf load per Figure 3.
4. Other frequencies may be available, please contact factory.
5. Combined Current From VDD, VDO, VDA, and VDB

Figure 2. Output Waveform

Figure 3. Output Test Conditions (25°C ±5°C)

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied at these or any other conditions in excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

| Table 2. Absolute Maximum Ratings | | | |
|-----------------------------------|-----------|------------|------|
| Parameter | Symbol | Ratings | Unit |
| Power Supply | V_{DD} | 7 | V |
| Storage Temperature | T_{STR} | -55 to 125 | °C |

Reliability

The FX-700 is capable of meeting the following qualification tests

Table 3. Environmental Compliance

| Parameter | Conditions |
|------------------------|--------------------------|
| Mechanical Shock | MIL-STD-883, Method 2002 |
| Mechanical Vibration | MIL-STD-883, Method 2007 |
| Solderability | MIL-STD-883, Method 2003 |
| Gross and Fine Leak | MIL-STD-883, Method 1014 |
| Resistance to Solvents | MIL-STD-883, Method 2016 |

Handling Precautions

Although ESD protection circuitry has been designed into the the FX-700, proper precautions should be taken when handling and mounting. VI employs a human body model and a charged-device model (CDM) for ESD susceptibility testing and design protection evaluation. ESD thresholds are dependent on the circuit parameters used to define the model. Although no industry wide standard has been adopted for the CDM, a standard HBM of resistance=1.5Kohms and capacitance = 100pF is widely used and therefore can be used for comparison purposes

Table 4. Predicted ESD Ratings

| Model | Minimum | Conditions |
|----------------------|---------|--------------------------|
| Human Body Model | 1500 V | MIL-STD 883, Method 3015 |
| Charged Device Model | 1000 V | JEDEC, JESD22-C101 |

Solder Reflow Profile

Table 5. Reflow Profile (IPC/JEDEC J-STD-020C)

| Parameter | Symbol | Value |
|--------------------------|-------------|-------------------------|
| PreHeat Time | t_s | 60 sec Min, 180 sec Max |
| Ramp Up | R_{UP} | 3 °C/sec Max |
| Time Above 217 °C | t_L | 60 sec Min, 150 sec Max |
| Time To Peak Temperature | t_{AMB-P} | 480 sec Max |
| Time At 260 °C | t_p | 20 sec Min, 40 sec Max |
| Ramp Down | R_{DN} | 6 °C/sec Max |

The device has been qualified to meet the JEDEC standard for Pb-Free assembly. The temperatures and time intervals listed are based on the Pb-Free small body requirements. The temperatures refer to the topside of the package, measured on the package body surface. The FX-700 device is hermetically sealed so an aqueous wash is not an issue.

Figure 3. Suggested IR Profile

Dimensions in mm.

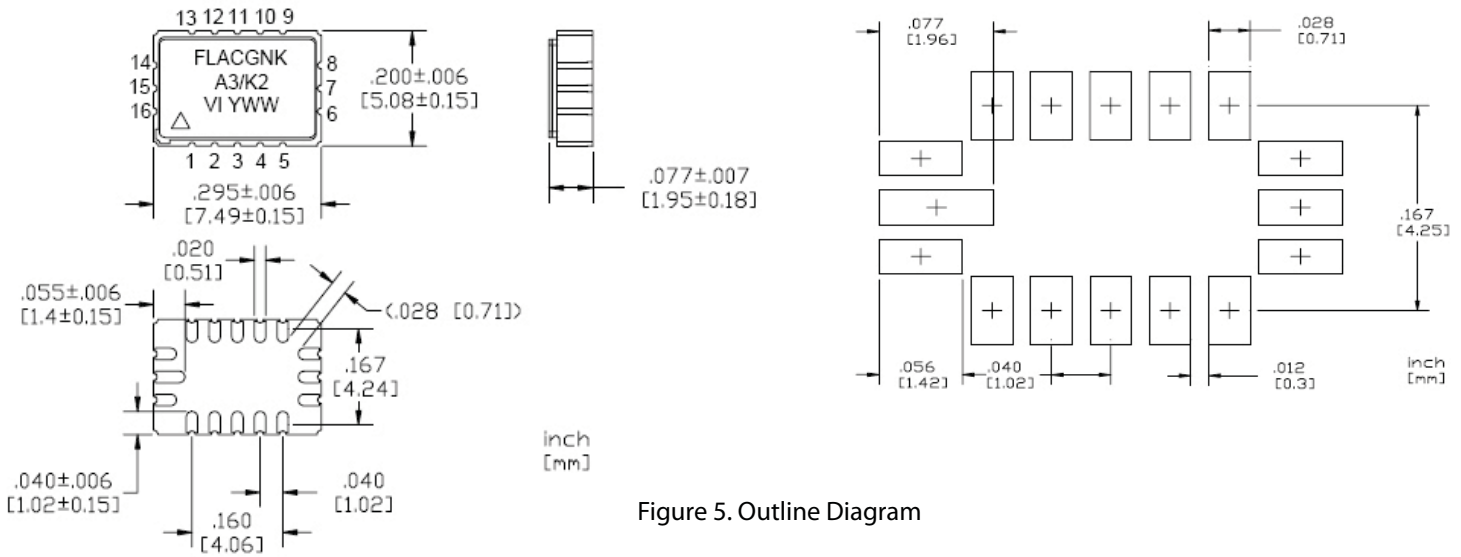

Figure 5. Outline Diagram

| Table 7. Pin Functions | | |
|------------------------|------------------------|--|
| Pad # | Symbol | Function |
| 1 | V _{DD} | Digital PLL Supply (3.3 V +/- 10% or 5.0 V +/- 10%) |
| 2 | V _{DA} | Analog PLL Supply (3.3 V +/- 10% or 5.0 V +/- 10%) |
| 3 | V _{COU} T | Control Voltage |
| 4 | Tri-state ¹ | Logic Low = Output Disable / Logic High = Output Enabled |
| 5 | C1 | Passive Loop Filter Node |
| 6 | FIN | Input Frequency |
| 7 | GND | Cover and Electrical Ground |
| 8 | LD ² | Lock Detect |
| 9 | GNDB | Output Buffer Ground |
| 10 | FOU | Output Frequency |
| 11 | VDB | Output Buffer Supply (3.3 V +/- 10% or 5.0 V +/- 10%) |
| 12 | VCXO _{IN} | VCXO Input |
| 13 | VCXO _{OUT} | VCXO Output |
| 14 | V _{DO} | VCXO Supply (3.3 V +/- 10% or 5.0 V +/- 10%) |
| 15 | N.C. | No Internal Connection Made |
| 16 | V _{CIN} | VCXO Control Voltage Input |

1 Tri-state must be driven to a logic high or a logic low, there is no internal pull up or pull down resistor (tie pin to VDD for PLL operation).
 2 LD is an open collector output requiring a 30k ohm minimum pull-up resistor to VDD. LD output is logic high under locked condition, logic low for no input at FIN, and for "out-of-lock" condition LD transitions between logic low and high at the phase detector frequency.

Tape and Reel

Table 6. Tape and Reel Information

| Tape Dimensions (mm) | | | | | Reel Dimensions (mm) | | | | | | | |
|----------------------|-----|-----|---|---|----------------------|------|----|----|---|------|-----|--------|
| A | B | C | D | E | F | G | H | I | J | K | L | #/Reel |
| 16 | 7.5 | 1.5 | 4 | 8 | 1.5 | 20.2 | 13 | 50 | 6 | 16.4 | 178 | 500 |

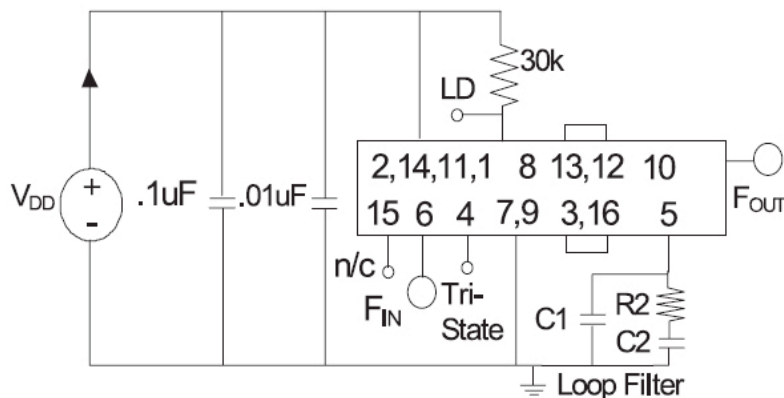

Figure 4. Tape and Reel

FX-700 Theory of Operation

The FX-700 includes an integrated phase detector, current mode charge pump, programmable frequency dividers and VCXO. The FX-700 will translate an input frequency such as 8 kHz, 1.544 MHz or 19.440 MHz to a specific output frequency which is an integer multiple (1-16384) of the input frequency and less than or equal to 77.760 MHz. For clock smoothing applications, the input frequency is typically internally divided down by a factor of 64 (2^N where N = 6) by the input frequency divider and this frequency becomes an input to the phase detector. The integrated frequency dividers (factory programmed) and crystal based VCXO allows for a large range of possible frequency translations and clock smoothing applications.

The FX-700's PLL is a feedback system which forces the output frequency to lock in both phase and frequency to the input frequency. While there will be some phase error, theory states there is no frequency error. The loop filter design will dictate many key parameters such as jitter reduction, stability, lock range and acquisition time. The external second order passive loop filter is a complex impedance in parallel with the input capacitance of the VCXO. The loop filter converts the charge pump output into the VCXO's control voltage. VI's loop filter design methodology involves the calculation of the open loop gain bandwidth and corresponding phase margin to determine the optimal component values that ensure high loop stability and acceptable lock in time. As a rule of thumb, the VCXO gain is typically 100 ppm/volt and the charge pump current is typically 32 uA.

VI's Applications Engineering staff can provide the external loop filter component values required to meet specific system requirements and application.
