PbS photoconductive detector
P9217 series

Room-temperature detectors capable of detecting up to 2.9 µm

P9217 is a PbS photoconductive detector with greatly improved stability and resistance to high temperatures as compared with conventional types.

Features

- High reliability: high temperature resistant

Applications

- Radiation thermometers
- Flame monitors
- Water content analyzers
- Food ingredient analysis
- Spectrophotometers

Accessories (Optional)

- Preamplifier for PbS/PbSe photoconductive detector C3757-02

*1: Window material K: Borosilicate glass

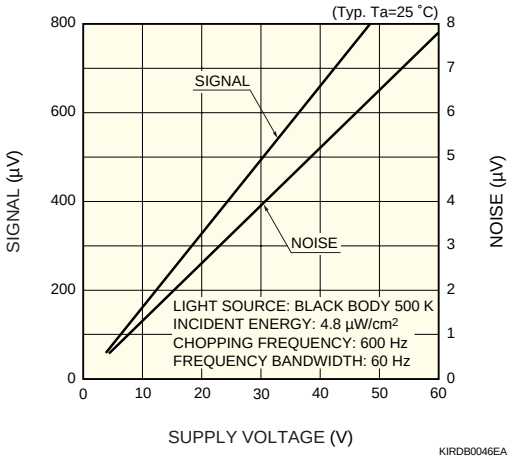

*2: Chopping frequency: 600 Hz, load resistance: nearly equal to detector element dark resistance.

SOLID STATE DIVISION

■ Spectral response

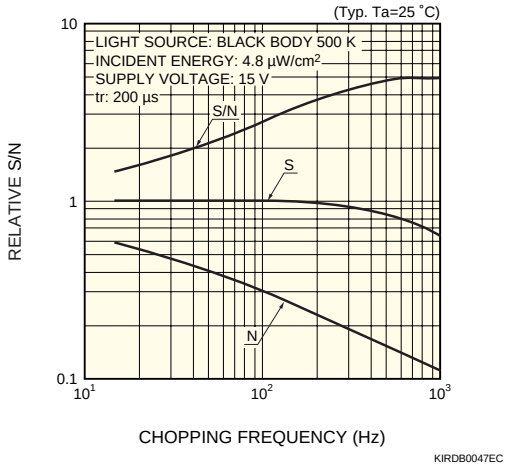

■ S/N vs. supply voltage

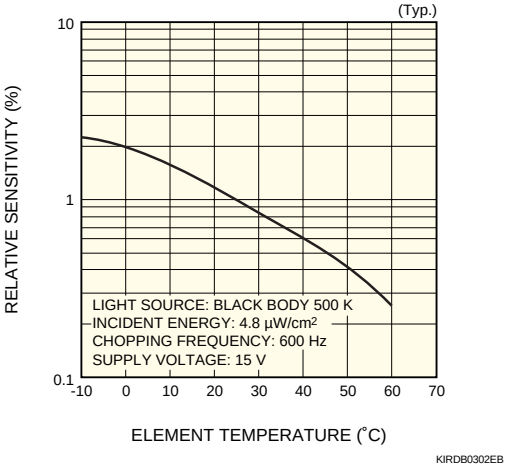

If voltage of higher than 60 V is applied, the noise increases exponentially, degrading the S/N. The device should be operated at 60 V or less.

■ S/N vs. chopping frequency

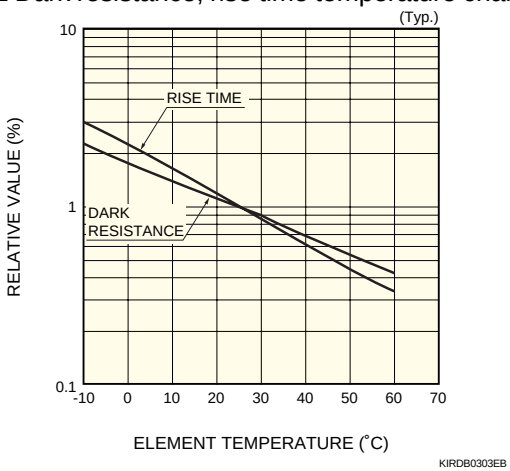

Increasing the chopping frequency reduces the 1/f noise and results in an S/N improvement. The S/N can also be improved by narrowing the noise bandwidth using a lock-in amplifier.

■ Photo sensitivity temperature characteristic

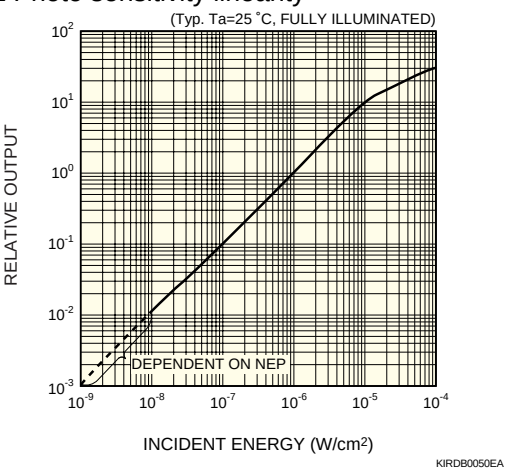

Cooling the device enhances its sensitivity, but the sensitivity also depends on the load resistance in the circuit.

■ Dark resistance, rise time temperature characteristics

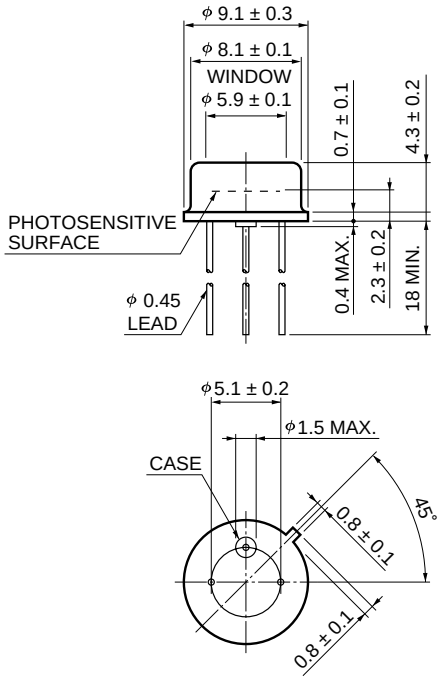

■ Photo sensitivity linearity

By making the incident light spot smaller than the active area, the upper limit of the linearity becomes lower.
