

To all our customers

Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

User's Manual

keep safety first in your circuit designs !

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination. Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.

Preface

This user's manual describes Mitsubishi's CMOS 8-bit microcomputers 3802 Group.

After reading this manual, the user should have a thorough knowledge of the functions and features of the 3802 Group, and should be able to fully utilize the product. The manual starts with specifications and ends with application examples.

For details of software, refer to the "SERIES MELPS 740 <SOFTWARE> USER'S MANUAL."

For details of development support tools, refer to the "DEVELOPMENT SUPPORT TOOLS FOR MICRO-COMPUTERS" data book.

BEFORE USING THIS USER'S MANUAL

This user's manual consists of the following three chapters. Refer to the chapter appropriate to your conditions, such as hardware design or software development. Chapter 3 also includes necessary information for systems development. Be sure to refer to this chapter.

1. Organization

● CHAPTER 1 HARDWARE

This chapter describes features of the microcomputer and operation of each peripheral function.

● CHAPTER 2 APPLICATION

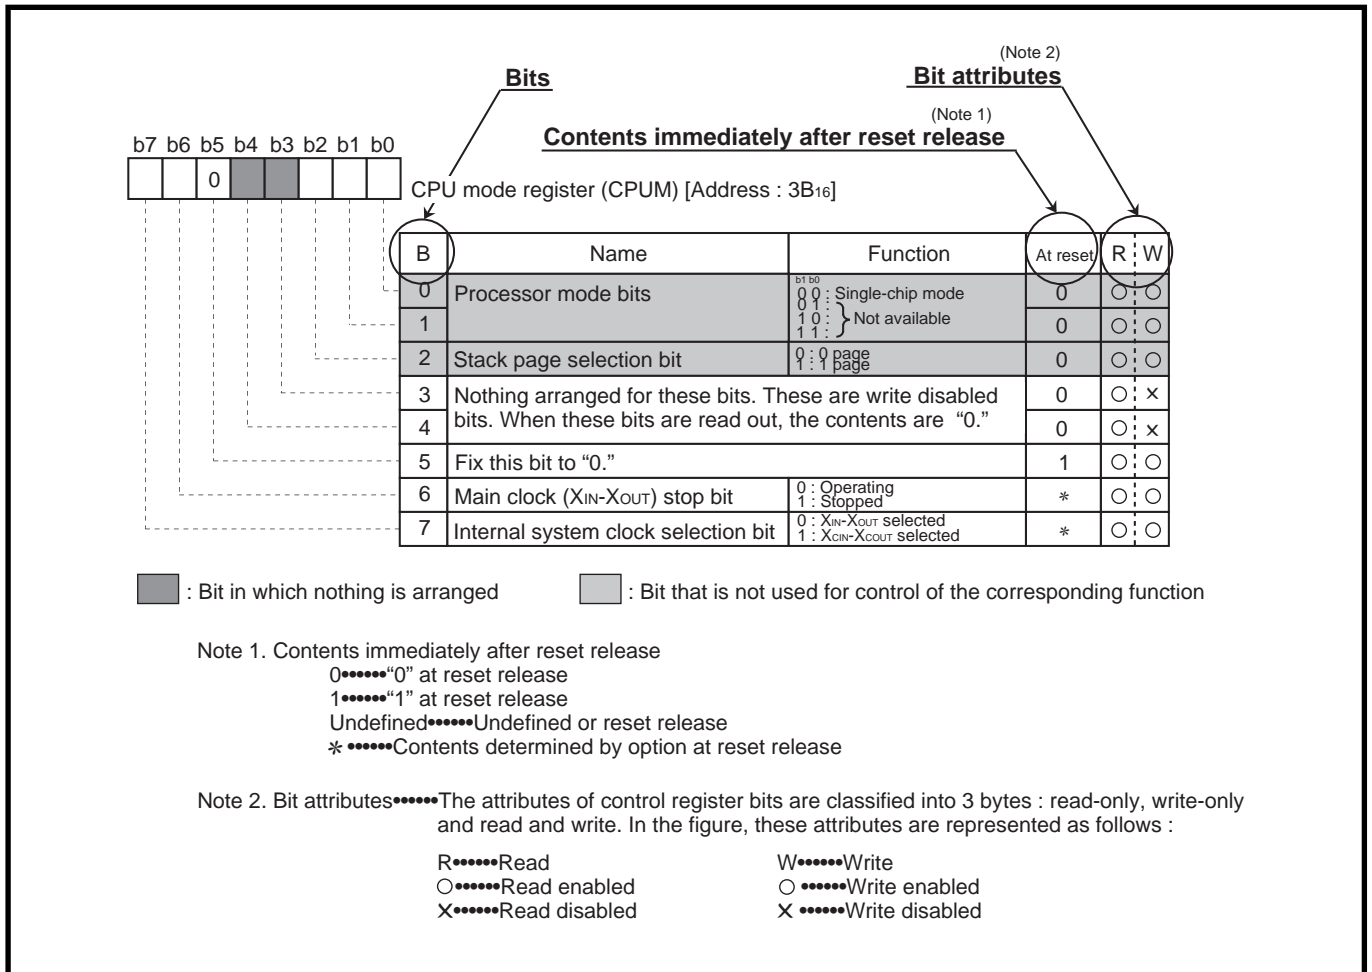

This chapter describes usage and application examples of peripheral functions, based mainly on setting examples of related registers.

● CHAPTER 3 APPENDIX

This chapter includes necessary information for systems development using the microcomputer, electric characteristics, a list of registers, the masking confirmation (mask ROM version), and mark specifications which are to be submitted when ordering.

2. Structure of register

The figure of each register structure describes its functions, contents at reset, and attributes as follows :

LIST OF GROUPS HAVING THE SIMILAR FUNCTIONS

3802 group, one of the CMOS 8-bit microcomputer 38000 series presented in this user's manual is provided with standard functions.

The basic functions of the 3800, 3802, 3806 and 3807 groups having the same functions are shown below. For the detailed functions of each group, refer to the related data book and user's manual.

List of groups having the same functions

As of September 1995

Group		3800 group					3802 group				3806 group					3807 group
Function	Group															
Pin (Package type)		64 pin • 64P4B • 64P6N-A • 64P6D-A					64 pin • 64P4B • 64P6N-A				80 pin • 80P6N-A • 80P6S-A • 80P6D-A					80 pin • 80P6N-A
Clock generating circuit		1 circuit					1 circuit				1 circuit					2 circuit

DESCRIPTION/FEATURES/APPLICATIONS/PIN CONFIGURATION

DESCRIPTION

The 3802 group is the 8-bit microcomputer based on the 740 family core technology.

The 3802 group is designed for controlling systems that require analog signal processing and include two serial I/O functions, A-D converters, and D-A converters.

The various microcomputers in the 3802 group include variations of internal memory size and packaging. For details, refer to the section on part numbering.

For details on availability of microcomputers in the 3802 group, refer to the section on group expansion.

FEATURES

- Basic machine-language instructions 71
- The minimum instruction execution time 0.5 μ s (at 8 MHz oscillation frequency)
- Memory size
 - ROM 8 K to 32 K bytes
 - RAM 384 to 1024 bytes

- Programmable input/output ports 56
- Interrupts 16 sources, 16 vectors
- Timers 8 bit X 4
- Serial I/O1 8-bit X 1 (UART or Clock-synchronized)
- Serial I/O2 8-bit X 1 (Clock-synchronized)
- PWM 8-bit X 1
- A-D converter 8-bit X 8 channels
- D-A converter 8-bit X 2 channels
- Clock generating circuit Internal feedback resistor (connect to external ceramic resonator or quartz-crystal oscillator)
- Power source voltage 3.0 to 5.5 V (Extended operating temperature version : 4.0 to 5.5 V)
- Power dissipation 32 mW
- Memory expansion possible
- Operating temperature range -20 to 85°C (Extended operating temperature version : -40 to 85°C)

APPLICATIONS

Office automation, VCRs, tuners, musical instruments, cameras, air conditioners, etc.

GROUP EXPANSION

Mitsubishi plans to expand the 3802 group as follows:

- (1) Support for mask ROM, One Time PROM, and EPROM versions
 ROM/PROM capacity 8 K to 32 K bytes
 RAM capacity 384 to 1024 bytes

- (2) Packages
 64P4B Shrink plastic molded DIP
 64P6N-A Plastic molded QFP
 64S1B-E Shrink ceramic DIP
 64D0 Ceramic LCC

FUNCTIONAL DESCRIPTION Central Processing Unit (CPU)

The 3802 group uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine instructions or the SERIES 740 <Software> User's Manual for details on the instruction set.

Machine-resident 740 family instructions are as follows:

The FST and SLW instructions cannot be used.

The MUL, DIV, WIT and STP instruction can be used.

The central processing unit (CPU) has the six registers.

Accumulator (A)

The accumulator is an 8-bit register. Data operations such as data transfer, etc., are executed mainly through the accumulator.

Index register X (X), Index register Y (Y)

Both index register X and index register Y are 8-bit registers. In the index addressing modes, the value of the OPERAND is added to the contents of register X or register Y and specifies the real address.

When the T flag in the processor status register is set to "1", the value contained in index register X becomes the address for the second OPERAND.

Stack pointer (S)

The stack pointer is an 8-bit register used during sub-routine calls and interrupts. The stack is used to store the current address data and processor status when branching to subroutines or interrupt routines.

The lower eight bits of the stack address are determined by the contents of the stack pointer. The upper eight bits of the stack address are determined by the Stack Page Selection Bit. If the Stack Page Selection Bit is "0", then the RAM in the zero page is used as the stack area. If the Stack Page Selection Bit is "1", then RAM in page 1 is used as the stack area.

The Stack Page Selection Bit is located in the SFR area in the zero page. Note that the initial value of the Stack Page Selection Bit varies with each microcomputer type. Also some microcomputer types have no Stack Page Selection Bit and the upper eight bits of the stack address are fixed. The operations of pushing register contents onto the stack and popping them from the stack are shown in Fig.7.

Program counter (PC)

The program counter is a 16-bit counter consisting of two 8-bit registers PCH and PCL. It is used to indicate the address of the next instruction to be executed.

Fig. 7. 740 Family CPU register structure

HARDWARE

FUNCTIONAL DESCRIPTION

Fig. 8. Register push and pop at interrupt generation and subroutine call

Table. 4. Push and pop instructions of accumulator or processor status register

	Push instruction to stack	Pop instruction from stack
Accumulator	PHA	PLA
Processor status register	PHP	PLP

Processor status register (PS)

The processor status register is an 8-bit register consisting of flags which indicate the status of the processor after an arithmetic operation. Branch operations can be performed by testing the Carry (C) flag, Zero (Z) flag, Overflow (V) flag, or the Negative (N) flag. In decimal mode, the Z, V, N flags are not valid.

After reset, the Interrupt disable (I) flag is set to "1", but all other flags are undefined. Since the Index X mode (T) and Decimal mode (D) flags directly affect arithmetic operations, they should be initialized in the beginning of a program.

(1) Carry flag (C)

The C flag contains a carry or borrow generated by the arithmetic logic unit (ALU) immediately after an arithmetic operation. It can also be changed by a shift or rotate instruction.

(2) Zero flag (Z)

The Z flag is set if the result of an immediate arithmetic operation or a data transfer is "0", and cleared if the result is anything other than "0".

(3) Interrupt disable flag (I)

The I flag disables all interrupts except for the interrupt generated by the BRK instruction.

Interrupts are disabled when the I flag is "1".

When an interrupt occurs, this flag is automatically set to "1" to prevent other interrupts from interfering until the current interrupt is serviced.

(4) Decimal mode flag (D)

The D flag determines whether additions and subtractions are executed in binary or decimal. Binary arithmetic is executed when this flag is "0"; decimal arithmetic is executed when it is "1".

Decimal correction is automatic in decimal mode. Only the ADC and SBC instructions can be used for decimal arithmetic.

(5) Break flag (B)

The B flag is used to indicate that the current interrupt was generated by the BRK instruction. The BRK flag in the processor status register is always "0". When the BRK instruction is used to generate an interrupt, the processor status register is pushed onto the stack with the break flag set to "1". The saved processor status is the only place where the break flag is ever set.

(6) Index X mode flag (T)

When the T flag is "0", arithmetic operations are performed between accumulator and memory, e.g. the results of an operation between two memory locations is stored in the accumulator. When the T flag is "1", direct arithmetic operations and direct data transfers are enabled between memory locations, i.e. between memory and memory, memory and I/O, and I/O and I/O. In this case, the result of an arithmetic operation performed on data in memory location 1 and memory location 2 is stored in memory location 1. The address of memory location 1 is specified by index register X, and the address of memory location 2 is specified by normal addressing modes.

(7) Overflow flag (V)

The V flag is used during the addition or subtraction of one byte of signed data. It is set if the result exceeds +127 to -128. When the BIT instruction is executed, bit 6 of the memory location operated on by the BIT instruction is stored in the overflow flag.

(8) Negative flag (N)

The N flag is set if the result of an arithmetic operation or data transfer is negative. When the BIT instruction is executed, bit 7 of the memory location operated on by the BIT instruction is stored in the negative flag.

Table 5. Set and clear instructions of each bit of processor status register

	C flag	Z flag	I flag	D flag	B flag	T flag	V flag	N flag
Set instruction	SEC	–	SEI	SED	–	SET	–	–
Clear instruction	CLC	–	CLI	CLD	–	CLT	CLV	–

HARDWARE

FUNCTIONAL DESCRIPTION

CPU Mode Register

The CPU mode register is allocated at address 003B16. The CPU mode register contains the stack page selection bit.

Fig. 9. Structure of CPU mode register

Memory

Special function register (SFR) area

The Special Function Register area in the zero page contains control registers such as I/O ports and timers.

RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is user area for storing programs.

Interrupt vector area

The interrupt vector area contains reset and interrupt vectors.

Zero page

The 256 bytes from addresses 0000_{16} to $00FF_{16}$ are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

Special page

The 256 bytes from addresses $FF00_{16}$ to $FFFF_{16}$ are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

I/O Ports Direction registers

The 3802 group has 56 programmable I/O pins arranged in seven I/O ports (ports P0 to P6). The I/O ports have direction registers which determine the input/output direction of each individual pin. Each bit in a direction register corresponds to one pin, each pin can be set to be input port or output port.

When "0" is written to the bit corresponding to a pin, that pin becomes an input pin. When "1" is written to that bit, that pin becomes an output pin.

If data is read from a pin which is set to output, the value of the port output latch is read, not the value of the pin itself. Pins set to input are floating. If a pin set to input is written to, only the port output latch is written to and the pin remains floating.

Table 6. list of I/O port functions

Pin	Name	Input/Output	I/O Format	Non-Port Function	Related SFRs	Ref.No.
P00–P07	Port P0	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	Address low-order byte output	CPU mode register	(1)
P10–P17	Port P1	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	Address high-order byte output	CPU mode register	
P20–P27	Port P2	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	Data bus I/O	CPU mode register	
P30/DA1 P31/DA2 P32–P37	Port P3	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	D-A conversion output	AD/DA control register CPU mode register	(2)
				Control signal I/O	CPU mode register	(1)
P40/INT4, P41/INT0, P43/INT2 P44/RxD, P45/TxD, P46/SCLK1, P47/SRDY1	Port P4	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	External interrupt input	Interrupt edge selection register	(3)
				Serial I/O1 function I/O	Serial I/O1 control register UART control register	(4) (5) (6) (7)
P50/SIN2, P51/SOUT2, P52/SCLK2, P53/SRDY2 P54/CNTR0, P55/CNTR1 P56/PWM P57/INT3	Port P5	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	Serial I/O2 function I/O	Serial I/O2 control register	(8) (9) (10) (11)
				Timer X and Timer Y function I/O	Timer XY mode register	(12)
				PWM output	PWM control register	(13)
				External interrupt input	Interrupt edge selection register	(3)
P60/AN0– P67/AN7	Port P6	Input/output, individual bits	CMOS 3-state output CMOS compatible input level	A-D conversion input		(14)

Note 1: For details of the functions of ports P0 to P3 in modes other than single-chip mode, and how to use double-function ports as function I/O ports, refer to the applicable sections.

Note 2: Make sure that the input level at each pin is either 0 V or V_{CC} during execution of the STP instruction.

When an input level is at an intermediate potential, a current will flow from V_{CC} to V_{SS} through the input-stage gate.

Fig. 13 Port block diagram (single-chip mode) (2)

HARDWARE

FUNCTIONAL DESCRIPTION

INTERRUPTS

Interrupts occur by sixteen sources: seven external, eight internal, and one software.

Interrupt control

Each interrupt is controlled by an interrupt request bit, an interrupt enable bit, and the interrupt disable flag except for the software interrupt set by the BRK instruction. An interrupt occurs if the corresponding interrupt request and enable bits are "1" and the interrupt disable flag is "0".

Interrupt enable bits can be set or cleared by software.

Interrupt request bits can be cleared by software, but cannot be set by software.

The BRK instruction cannot be disabled with any flag or bit. The I (interrupt disable) flag disables all interrupts except the BRK instruction interrupt.

When several interrupts occur at the same time, the interrupts are received according to priority.

Interrupt operation

When an interrupt is received, the contents of the program counter and processor status register are automatically stored into the stack. The interrupt disable flag is set to inhibit other interrupts from interfering. The corresponding interrupt request bit is cleared and the interrupt jump destination address is read from the vector table into the program counter.

Notes on use

When the active edge of an external interrupt (INT0 to INT4, CNTR0, or CNTR1) is changed, the corresponding interrupt request bit may also be set. Therefore, please take following sequence;

- (1) Disable the external interrupt which is selected.
- (2) Change the active edge selection.
- (3) Clear the interrupt request bit which is selected to "0".
- (4) Enable the external interrupt which is selected.

Table 7. Interrupt vector addresses and priority

Interrupt Source	Priority	Vector Addresses (Note 1)		Interrupt Request Generating Conditions	Remarks
		High	Low		
Reset (Note 2)	1	FFFD ₁₆	FFFC ₁₆	At reset	Non-maskable
INT ₀	2	FFFB ₁₆	FFFA ₁₆	At detection of either rising or falling edge of INT ₀ input	External interrupt (active edge selectable)
INT ₁	3	FFF9 ₁₆	FFF8 ₁₆	At detection of either rising or falling edge of INT ₁ input	External interrupt (active edge selectable)
Serial I/O1 reception	4	FFF7 ₁₆	FFF6 ₁₆	At completion of serial I/O1 data reception	Valid when serial I/O1 is selected
Serial I/O1 transmission	5	FFF5 ₁₆	FFF4 ₁₆	At completion of serial I/O1 transfer shift or when transmission buffer is empty	Valid when serial I/O1 is selected

Fig. 15 Structure of interrupt-related registers

FUNCTIONAL DESCRIPTION

Timers

The 3802 group has four timers: timer X, timer Y, timer 1, and timer 2.

All timers are count down. When the timer reaches “0016”, an underflow occurs at the next count pulse and the corresponding timer latch is reloaded into the timer and the count is continued. When a timer underflows, the interrupt request bit corresponding to that timer is set to “1”.

The division ratio of each timer or prescaler is given by $1/(n + 1)$, where n is the value in the corresponding timer or prescaler latch.

Fig. 16 Structure of timer XY register

Timer 1 and Timer 2

The count source of prescaler 12 is the oscillation frequency divided by 16. The output of prescaler 12 is counted by timer 1 and timer 2, and a timer underflow sets the interrupt request bit.

Timer X and Timer Y

Timer X and Timer Y can each be selected in one of four operating modes by setting the timer XY mode register.

Timer Mode

The timer counts $f(XIN)/16$ in timer mode.

Pulse Output Mode

Timer X (or timer Y) counts $f(XIN)/16$. Whenever the contents of the timer reach “0016”, the signal output from the CNTR0 (or CNTR1) pin is inverted. If the CNTR0 (or CNTR1) active edge switch bit is “0”, output begins at “H”.

If it is “1”, output starts at “L”. When using a timer in this mode, set the corresponding port P54 (or port P55) direction register to output mode.

Event Counter Mode

Operation in event counter mode is the same as in timer mode, except the timer counts signals input through the CNTR0 or CNTR1 pin.

Pulse Width Measurement Mode

If the CNTR0 (or CNTR1) active edge selection bit is “0”, the timer counts at the oscillation frequency divided by 16 while the CNTR0 (or CNTR1) pin is at “H”. If the CNTR0 (or CNTR1) active edge switch bit is “1”, the count continues during the time that the CNTR0 (or CNTR1) pin is at “L”.

In all of these modes, the count can be stopped by setting the timer X (timer Y) count stop bit to “1”. Every time a timer underflows, the corresponding interrupt request bit is set.

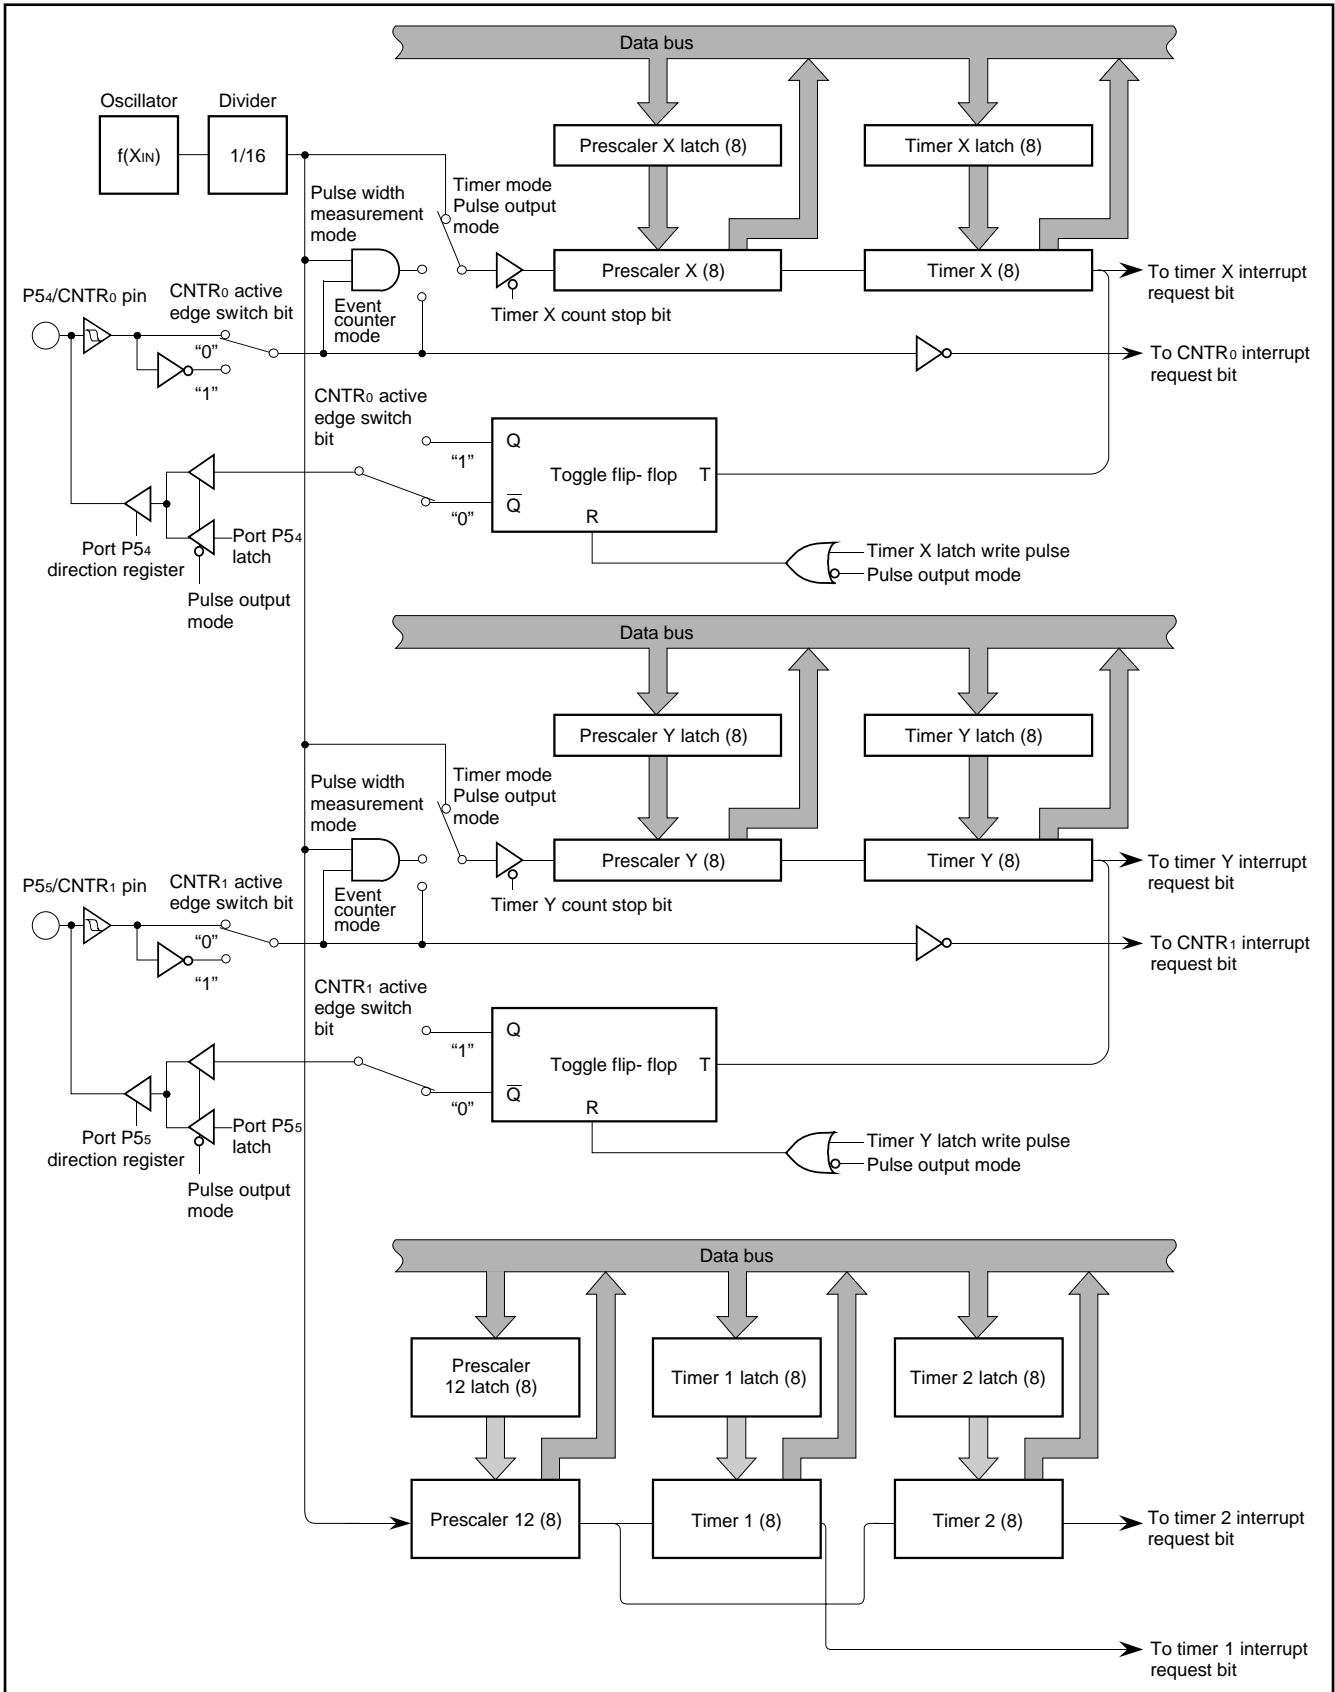

Fig. 17 Block diagram of timer X, timer Y, timer 1, and timer 2

Asynchronous serial I/O (UART) mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O mode selection bit of the serial I/O control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer, but the

two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer, and receive data is read from the receive buffer.

The transmit buffer can also hold the next data to be transmitted, and the receive buffer can hold a character while the next character is being received.

Fig. 20 Block diagram of UART serial I/O

FUNCTIONAL DESCRIPTION

Fig. 21 Operation of UART serial I/O function

Serial I/O1 control register (SIO1CON) 001A16

The serial I/O control register consists of eight control bits for the serial I/O function.

UART control register (UARTCON) 001B16

The UART control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer. One bit in this register (bit 4) is always valid and sets the output structure of the P45/TxD pin.

Serial I/O1 status register (SIO1STS) 001916

The read-only serial I/O1 status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer, and the receive buffer full flag is set. A write to the serial I/O status register clears all the error flags OE, PE, FE, and SE (bit 3 to bit 6, re-

spectively). Writing "0" to the serial I/O enable bit SIOE (bit 7 of the Serial I/O Control Register) also clears all the status flags, including the error flags.

All bits of the serial I/O1 status register are initialized to "0" at reset, but if the transmit enable bit (bit 4) of the serial I/O control register has been set to "1", the transmit shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

Transmit buffer/Receive buffer register (TB/RB) 001816

The transmit buffer and the receive buffer are located at the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

Baud rate generator (BRG) 001C16

The baud rate generator determines the baud rate for serial transfer.

The baud rate generator divides the frequency of the count source by $1/(n + 1)$, where n is the value written to the baud rate generator.

Fig. 22 Structure of serial I/O control registers

HARDWARE

FUNCTIONAL DESCRIPTION

Serial I/O2

The serial I/O2 function can be used only for clock synchronous serial I/O.

For clock synchronous serial I/O the transmitter and the receiver must use the same clock. If the internal clock is used, transfer is started by a write signal to the serial I/O2 register.

Serial I/O2 control register (SIO2CON) 001D16

The serial I/O2 control register contains seven bits which control various serial I/O functions.

Fig. 24 Block diagram of serial I/O2 function

Fig. 25 Timing of serial I/O2 function

HARDWARE

FUNCTIONAL DESCRIPTION

PULSE WIDTH MODULATION (PWM)

The 3802 group has a PWM function with an 8-bit resolution, based on a signal that is the clock input X_{IN} or that clock input divided by 2.

Data Setting

The PWM output pin also functions as port P5₆. Set the PWM period by the PWM prescaler, and set the period during which the output pulse is an "H" by the PWM register.

If the value in the PWM prescaler is n and the value in the PWM register is m (where n = 0 to 255 and m = 0 to 255) :

$$\begin{aligned} \text{PWM period} &= 255 \times (n+1) / f(\text{X}_{\text{IN}}) \\ &= 51 \times (n+1) \mu\text{s} \quad (\text{when } \text{X}_{\text{IN}} = 5 \text{ MHz}) \end{aligned}$$

$$\begin{aligned} \text{Output pulse "H" period} &= \text{PWM period} \times m / 255 \\ &= 0.2 \times (n+1) \times m \mu\text{s} \\ &\quad (\text{when } \text{X}_{\text{IN}} = 5 \text{ MHz}) \end{aligned}$$

PWM Operation

When bit 0 (PWM enable bit) of the PWM control register is set to "1", operation starts by initializing the PWM output circuit, and pulses are output starting at an "H".

If the PWM register or PWM prescaler is updated during PWM output, the pulses will change in the cycle after the one in which the change was made.

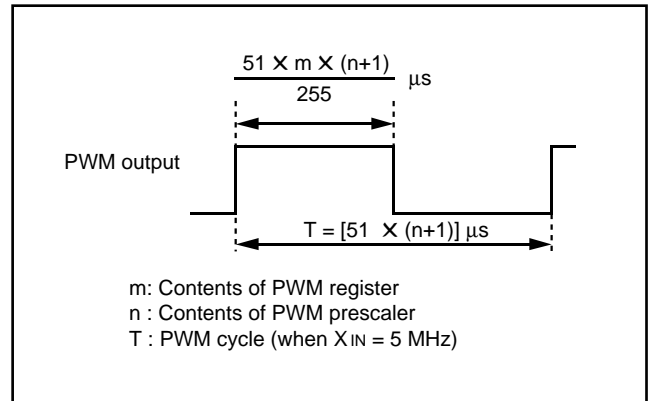

Fig. 26 Timing of PWM cycle

HARDWARE

FUNCTIONAL DESCRIPTION

A-D Converter

The functional blocks of the A-D converter are described below.

[A-D conversion register]

The A-D conversion register is a read-only register that stores the result of an A-D conversion. When reading this register during an A-D conversion, the previous conversion result is read.

[AD/DA control register]

The AD/DA control register controls the A-D conversion process. Bits 0 to 2 select a specific analog input pin. Bit 3 signals the completion of an A-D conversion. The value of this bit remains at "0" during an A-D conversion, and changes to "1" when an A-D conversion ends. Writing "0" to this bit starts the A-D conversion. Bits 6 and 7 are used to control the output of the D-A converter.

[Comparison voltage generator]

The comparison voltage generator divides the voltage between AVSS and VREF into 256, and outputs the divided voltages.

[Channel selector]

The channel selector selects one of the ports P60/AN0 to P67/AN7, and inputs the voltage to the comparator.

[Comparator and Control circuit]

The comparator and control circuit compares an analog input voltage with the comparison voltage, then stores the result in the A-D conversion register. When an A-D conversion is complete, the control circuit sets the AD conversion completion bit and the AD interrupt request bit to "1".

Note that the comparator is constructed linked to a capacitor, so set f(XIN) to 500 kHz or more during an A-D conversion.

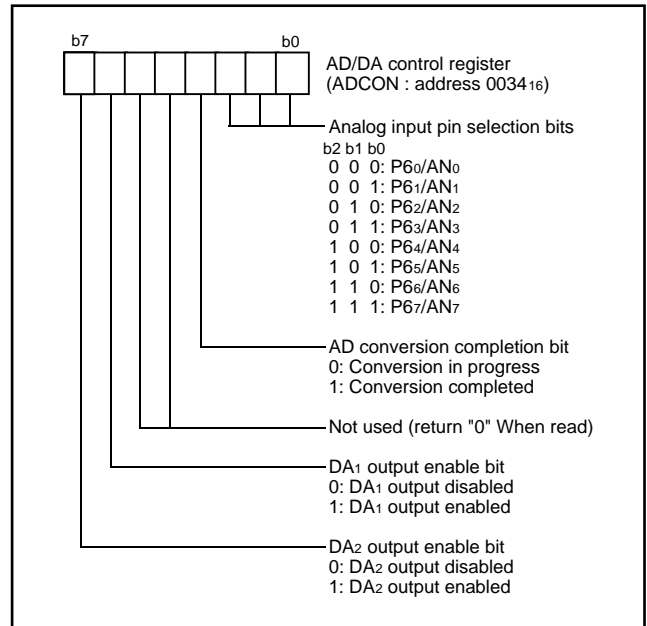

Fig.30 Structure of AD/DA control register

Fig. 31 Block diagram of A-D converter

D-A Converter

The 3802 group has two internal D-A converters (DA1 and DA2) with 8-bit resolutions.

The D-A converter is performed by setting the value in the D-A conversion register. The result of D-A converter is output from the DA1 or DA2 pin by setting the DA output enable bit to "1".

When using the D-A converter, the corresponding port direction register bit (P30/DA1 or P31/DA2) should be set to "0" (input status).

The output analog voltage V is determined by the value n (base 10) in the D-A conversion register as follows:

$$V = V_{REF} \times n / 256 \quad (n = 0 \text{ to } 255)$$

Where V_{REF} is the reference voltage.

At reset, the D-A conversion registers are cleared to "0016", the DA output enable bits are cleared to "0", and the P30/DA1 and P31/DA2 pins are set to input (high impedance).

The D-A output is not buffered, so connect an external buffer when driving a low-impedance load.

Set V_{CC} to 3.0 V or more when using the D-A converter.

Fig. 32 Block diagram of D-A converter

Fig. 33 Equivalent connection circuit of D-A converter

FUNCTIONAL DESCRIPTION

Reset Circuit

To reset the microcomputer, the $\overline{\text{RESET}}$ pin should be held at an "L" level for 2 μs or more. Then the $\overline{\text{RESET}}$ pin is returned to an "H" level (the power source voltage should be between 4.0 V and 5.5 V), reset is released. Internal operation begin until after 8 to 13 X_{IN} clock cycles are completed. After the reset is completed, the program starts from the address contained in address FFFD_{16} (high-order byte) and address FFFC_{16} (low-order byte).

Make sure that the reset input voltage is less than 0.6 V for V_{CC} of 3.0 V (Extended operating temperature version : the reset input voltage is less than 0.8 V for V_{CC} of 4.0 V).

Fig. 35 Internal status of microcomputer after reset

Fig. 36 Timing of reset

HARDWARE

FUNCTIONAL DESCRIPTION

Clock Generating Circuit

An oscillation circuit can be formed by connecting a resonator between XIN and XOUT. To supply a clock signal externally, input it to the XIN pin and make the XOUT pin open.

Oscillation control

Stop Mode

If the STP instruction is executed, the internal clock ϕ stops at an "H". Timer 1 is set to "0116" and prescaler 12 is set to "FF16". Oscillator restarts when an external interrupt is received, but the internal clock ϕ remains at an "H" until timer 1 underflow. This allows time for the clock circuit oscillation to stabilize. If oscillator is restarted by a reset, no wait time is generated, so keep the RESET pin at an "L" level until oscillation has stabilized.

Wait Mode

If the WIT instruction is executed, the internal clock ϕ stops at an "H" level, but the oscillator itself does not stop. The internal clock restarts if a reset occurs or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted. To ensure that interrupts will be received to release the STP or WIT state, interrupt enable bits must be set to "1" before the STP or WIT instruction is executed.

When the STP status is released, prescaler 12 and timer 1 will start counting and reset will not be released until timer 1 underflows, so set the timer 1 interrupt enable bit to "0" before the STP instruction is executed.

Fig. 37 Ceramic resonator circuit

Fig. 38 External clock input circuit

Fig. 39 Block diagram of clock generating circuit

Processor Modes

Single-chip mode, memory expansion mode, and microprocessor mode can be selected by changing the contents of the processor mode bits CM0 and CM1 (bits 0 and 1 of address 003B₁₆). In memory expansion mode and microprocessor mode, memory can be expanded externally through ports P0 to P3. In these modes, ports P0 to P3 lose their I/O port functions and become bus pins.

Table 8. Functions of ports in memory expansion mode and microprocessor mode

Port Name	Function
Port P0	Outputs low-order byte of address.
Port P1	Outputs high-order byte of address.
Port P2	Operates as I/O pins for data D7 to D0 (including instruction codes).
Port P3	P30 and P31 function only as output pins (except that the port latch cannot be read). P32 is the \overline{ONW} input pin. P33 is the $\overline{RESETOUT}$ output pin. (Note) P34 is the ϕ output pin. P35 is the SYNC output pin. P36 is the \overline{WR} output pin, and P37 is the \overline{RD} output pin.

Note: If CNVss is connected to Vss, the microcomputer goes to single-chip mode after a reset, so this pin cannot be used as the $\overline{RESETOUT}$ output pin.

Single-Chip Mode

Select this mode by resetting the microcomputer with CNVss connected to Vss.

Memory Expansion Mode

Select this mode by setting the processor mode bits to "01" in software with CNVss connected to Vss. This mode enables external memory expansion while maintaining the validity of the internal ROM. Internal ROM will take precedence over external memory if addresses conflict.

Microprocessor Mode

Select this mode by resetting the microcomputer with CNVss connected to Vcc, or by setting the processor mode bits to "10" in software with CNVss connected to Vss. In microprocessor mode, the internal ROM is no longer valid and external memory must be used.

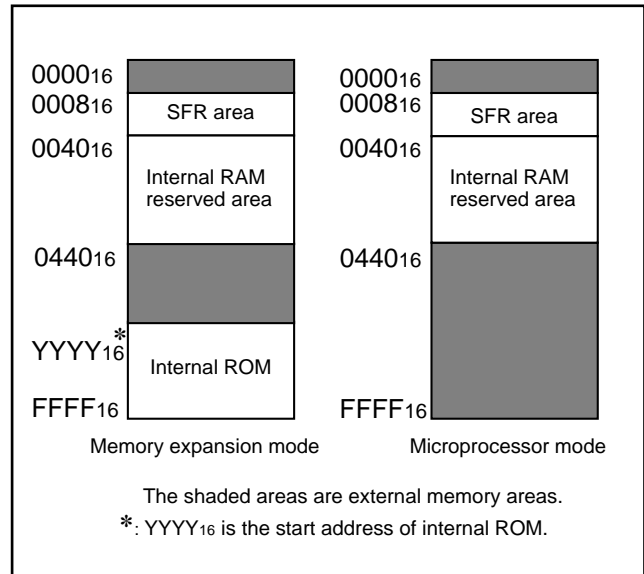

Fig. 40 Memory maps in various processor modes

Fig. 41 Structure of CPU mode register

HARDWARE

FUNCTIONAL DESCRIPTION

Bus control with memory expansion

The 3802 group has a built-in $\overline{\text{ONW}}$ function to facilitate access to external memory and I/O devices in memory expansion mode or microprocessor mode.

If an "L" level signal is input to the $\overline{\text{ONW}}$ pin when the CPU is in a read or write state, the corresponding read or write cycle is extended by one cycle of ϕ . During this extended period, the $\overline{\text{RD}}$ or $\overline{\text{WR}}$ signal remains at "L". This extension period is valid only for writing to and reading from addresses 0000₁₆ to 0007₁₆ and 0440₁₆ to FFFF₁₆ in microprocessor mode, 0440₁₆ to YYY₁₆ in memory expansion mode, and only read and write cycles are extended.

Fig. 42 $\overline{\text{ONW}}$ function timing

NOTES ON PROGRAMMING

Processor Status Register

The contents of the processor status register (PS) after a reset are undefined, except for the interrupt disable flag (I) which is "1". After a reset, initialize flags which affect program execution.

In particular, it is essential to initialize the index X mode (T) and the decimal mode (D) flags because of their effect on calculations.

Interrupts

The contents of the interrupt request bits do not change immediately after they have been written. After writing to an interrupt request register, execute at least one instruction before executing a BBC or BBS instruction.

Decimal Calculations

To calculate in decimal notation, set the decimal mode flag (D) to "1", then execute an ADC or SBC instruction. Only the ADC and SBC instructions yield proper decimal results. After executing an ADC or SBC instruction, execute at least one instruction before executing a SEC, CLC, or CLD instruction.

In decimal mode, the values of the negative (N), overflow (V), and zero (Z) flags are invalid.

The carry flag can be used to indicate whether a carry or borrow has occurred. Initialize the carry flag before each calculation. Clear the carry flag before an ADC and set the flag before an SBC.

Timers

If a value n (between 0 and 255) is written to a timer latch, the frequency division ratio is $1/(n + 1)$.

Multiplication and Division Instructions

The index X mode (T) and the decimal mode (D) flags do not affect the MUL and DIV instruction.

The execution of these instructions does not change the contents of the processor status register.

Ports

The contents of the port direction registers cannot be read.

The following cannot be used:

- The data transfer instruction (LDA, etc.)
- The operation instruction when the index X mode flag (T) is "1"
- The addressing mode which uses the value of a direction register as an index
- The bit-test instruction (BBC or BBS, etc.) to a direction register
- The read-modify-write instruction (ROR, CLB, or SEB, etc.) to a direction register

Use instructions such as LDM and STA, etc., to set the port direction registers.

Serial I/O

In clock synchronous serial I/O, if the receive side is using an external clock and it is to output the $\overline{\text{SRDY1}}$ signal, set the transmit enable bit, the receive enable bit, and the $\overline{\text{SRDY1}}$ output enable bit to "1".

Serial I/O1 continues to output the final bit from the TxD pin after transmission is completed. The SOUT2 pin from serial I/O2 goes to high impedance after transmission is completed.

A-D Converter

The comparator uses internal capacitors whose charge will be lost if the clock frequency is too low.

Make sure that $f(\text{XIN})$ is at least 500 kHz during an A-D conversion. (If the $\overline{\text{ONW}}$ pin has been set to "L", the A-D conversion will take twice as long to match the longer bus cycle, and so $f(\text{XIN})$ must be at least 1 MHz.)

Do not execute the STP or WIT instruction during an A-D conversion.

D-A Converter

The accuracy of the D-A converter becomes poor rapidly under the $V_{CC} = 3.0 \text{ V}$ or less condition.

Instruction Execution Time

The instruction execution time is obtained by multiplying the frequency of the internal clock ϕ by the number of cycles needed to execute an instruction.

The number of cycles required to execute an instruction is shown in the list of machine instructions.

The frequency of the internal clock ϕ is half of the XIN frequency. When the $\overline{\text{ONW}}$ function is used in modes other than single-chip mode, the frequency of the internal clock ϕ may be one fourth the XIN frequency.

Memory Expansion Mode

The memory expansion mode is not available in the following microcomputers.

- M38024M6-XXXSP
- M38024M6-XXXFP

Memory Expansion Mode and Microprocessor Mode

Execute the LDM or STA instruction for writing to port P3 (address 000616) in memory expansion mode and microprocessor mode.

Set areas which can be read out and write to port P3 (address 000616) in a memory, using the read-modify-write instruction (SEB, CLB).

HARDWARE

DATA REQUIRED FOR MASK ORDERS/ROM PROGRAMMING METHOD

DATA REQUIRED FOR MASK ORDERS

The following are necessary when ordering a mask ROM production:

1. Mask ROM Order Confirmation Form
2. Mark Specification Form
3. Data to be written to ROM, in EPROM form (three identical copies)

ROM PROGRAMMING METHOD

The built-in PROM of the blank One Time PROM version and built-in EPROM version can be read or programmed with a general-purpose PROM programmer using a special programming adapter. Set the address of PROM programmer in the user ROM area.

Table 9. Programming adapter

Package	Name of Programming Adapter
64P4B, 64S1B	PCA4738S-64A
64P6N	PCA4738F-64A
64D0	PCA4738L-64A

The PROM of the blank One Time PROM version is not tested or screened in the assembly process and following processes. To ensure proper operation after programming, the procedure shown in Figure 35 is recommended to verify programming.

Fig. 43 Programming and testing of One Time PROM version

FUNCTIONAL DESCRIPTION SUPPLEMENT

Interrupt

3802 group permits interrupts on the basis of 16 sources. It is vector interrupts with a fixed priority system. Accordingly, when two or more interrupt

requests occur during the same sampling, the higher-priority interrupt is accepted first. This priority is determined by hardware, but variety of priority processing can be performed by software, using an interrupt enable bit and an interrupt disable flag. For interrupt sources, vector addresses and interrupt priority, refer to “**Table 10.**”

Table 10. Interrupt sources, vector addresses and interrupt priority

Priority	Interrupt sources	Vector addresses		Remarks
		High-order	Low-order	
1	Reset (Note)	FFFD ₁₆	FFFC ₁₆	Non-maskable
2	INT ₀ interrupt	FFFB ₁₆	FFFA ₁₆	External interrupt (active edge selectable)
3	INT ₁ interrupt	FFF9 ₁₆	FFF8 ₁₆	External interrupt (active edge selectable)
4	Serial I/O ₁ receive interrupt	FFF7 ₁₆	FFF6 ₁₆	Valid when serial I/O ₁ is selected
5	Serial I/O ₁ transmit interrupt	FFF5 ₁₆	FFF4 ₁₆	Valid when serial I/O ₁ is selected
6	Timer X interrupt	FFF3 ₁₆	FFF2 ₁₆	
7	Timer Y interrupt	FFF1 ₁₆	FFF0 ₁₆	
8	Timer 1 interrupt	FFEF ₁₆	FFEE ₁₆	STP release timer underflow
9	Timer 2 interrupt	FFED ₁₆	FFEC ₁₆	
10	CNTR ₀ interrupt	FFEB ₁₆	FFEA ₁₆	External interrupt (active edge selectable)
11	CNTR ₁ interrupt	FFE9 ₁₆	FFE8 ₁₆	External interrupt (active edge selectable)
12	Serial I/O ₂ interrupt	FFE7 ₁₆	FFE6 ₁₆	Valid when serial I/O ₂ is selected
13	INT ₂ interrupt	FFE5 ₁₆	FFE4 ₁₆	External interrupt (active edge selectable)
14	INT ₃ interrupt	FFE3 ₁₆	FFE2 ₁₆	External interrupt (active edge selectable)
15	INT ₄ interrupt	FFE1 ₁₆	FFE0 ₁₆	External interrupt (active edge selectable)
16	A-D conversion interrupt	FFDF ₁₆	FFDE ₁₆	
17	BRK instruction interrupt	FFDD ₁₆	FFDC ₁₆	Non-maskable software interrupt

Note: Reset functions in the same way as an interrupt with the highest priority.

HARDWARE

FUNCTIONAL DESCRIPTION SUPPLEMENT

Timing After Interrupt

The interrupt processing routine begins with the machine cycle following the completion of the instruction that is currently in execution.

Figure 44 shows a timing chart after an interrupt occurs, and Figure 45 shows the time up to execution of the interrupt processing routine.

Fig. 44 Timing chart after an interrupt occurs

Fig. 45 Time up to execution of the interrupt processing routine

A-D Converter

A-D conversion is started by setting AD conversion completion bit to "0." During A-D conversion, internal operations are performed as follows.

1. After the start of A-D conversion, A-D conversion register goes to "0016."
2. The highest-order bit of A-D conversion register is set to "1," and the comparison voltage V_{ref} is input to the comparator. Then, V_{ref} is compared with analog input voltage V_{IN} .
3. As a result of comparison, when $V_{ref} < V_{IN}$, the highest-order bit of A-D conversion register becomes "1." When $V_{ref} > V_{IN}$, the highest-order bit becomes "0."

By repeating the above operations up to the lowest-order bit of the A-D conversion register, an analog value converts into a digital value.

A-D conversion completes at 50 clock cycles (12.5 μ s at $f(X_{IN}) = 8.0$ MHz) after it is started, and the result of the conversion is stored into the A-D conversion register.

Concurrently with the completion of A-D conversion, A-D conversion interrupt request occurs, so that the AD conversion interrupt request bit is set to "1."

Relative formula for a reference voltage V_{REF} of A-D converter and V_{ref}

When $n = 0$ $V_{ref} = 0$

When $n = 1$ to 255 $V_{ref} = \frac{V_{REF}}{256} \times (n - 0.5)$

n : the value of A-D converter (decimal numeral)

Table 11. Change of A-D conversion register during A-D conversion

	Change of A-D conversion register	Value of comparison voltage (V_{ref})

2.2.3 Timer application examples

(1) Basic functions and uses

[Function 1] Control of Event interval (Timer X, Timer Y, Timer 1, Timer 2)

The Timer count stop bit is set to "0" after setting a count value to a timer. Then a timer interrupt request occurs after a certain period.

- [Use]**
- Generation of an output signal timing
 - Generation of a waiting time

[Function 2] Control of Cyclic operation (Timer X, Timer Y, Timer 1, Timer 2)

The value of a timer latch is automatically written to a corresponding timer every time a timer underflows, and each cyclic timer interrupt request occurs.

- [Use]**
- Generation of cyclic interrupts
 - Clock function (measurement of 250m second) → Application example 1
 - Control of a main routine cycle

[Function 3] Output of Rectangular waveform (Timer X, Timer Y)

The output level of the CNTR pin is inverted every time a timer underflows (Pulse output mode).

- [Use]**
- A piezoelectric buzzer output → Application example 2
 - Generation of the remote-control carrier waveforms

[Function 4] Count of External pulse (Timer X, Timer Y)

External pulses input to the CNTR pin are selected as a timer count source (Event counter mode).

- [Use]**
- Measurement of frequency → Application example 3
 - Division of external pulses.
 - Generation of interrupts in a cycle based on an external pulse.
(count of a reel pulse)

[Function 5] Measurement of External pulse width (Timer X, Timer Y)

The "H" or "L" level width of external pulses input to CNTR pin is measured (Pulse width measurement mode).

- [Use]**
- Measurement of external pulse frequency (Measurement of pulse width of FG pulse* generated by motor) → Application example 4
 - Measurement of external pulse duty (when the frequency is fixed)

*FG pulse : Pulse used for detecting the motor speed to control the motor speed.

APPLICATION

2.2 Timer

(2) Timer application example 1 : Clock function (measurement of 250 ms)

Outline : The input clock is divided by a timer so that the clock counts up every 250 ms.

Specifications :

- The clock $f(X_{IN}) = 4.19 \text{ MHz}$ (2^{22} Hz) is divided by a timer.
- The clock is counted at intervals of 250 ms by the Timer X interrupt.

Figure 2.2.10 shows a connection of timers and a setting of division ratios, Figures 2.2.11 show a setting of related registers, and Figure 2.2.12 shows a control procedure.

Fig. 2.2.10 Connection of timers and setting of division ratios [Clock function]

APPLICATION

2.2 Timer

Control procedure :

Figure 2.2.12 shows a control procedure.

Fig. 2.2.12 Control procedure [Clock function]

(3) Timer application example 2 : Piezoelectric buzzer output

Outline : The rectangular waveform output function of a timer is applied for a piezoelectric buzzer output.

- Specifications :**
- The rectangular waveform resulting from dividing clock $f(X_{IN}) = 4.19 \text{ MHz}$ into about 2 kHz (2048 Hz) is output from the P54/CNTR0 pin.
 - The level of the P54/CNTR0 pin fixes to "H" while a piezoelectric buzzer output is stopped.

Figure 2.2.13 shows an example of a peripheral circuit, and Figure 2.2.14 shows a connection of the timer and setting of the division ratio.

APPLICATION

2.2 Timer

Fig. 2.2.15 Setting of related registers [Piezoelectric buzzer output]

Control procedure :

Figure 2.2.16 shows a control procedure.

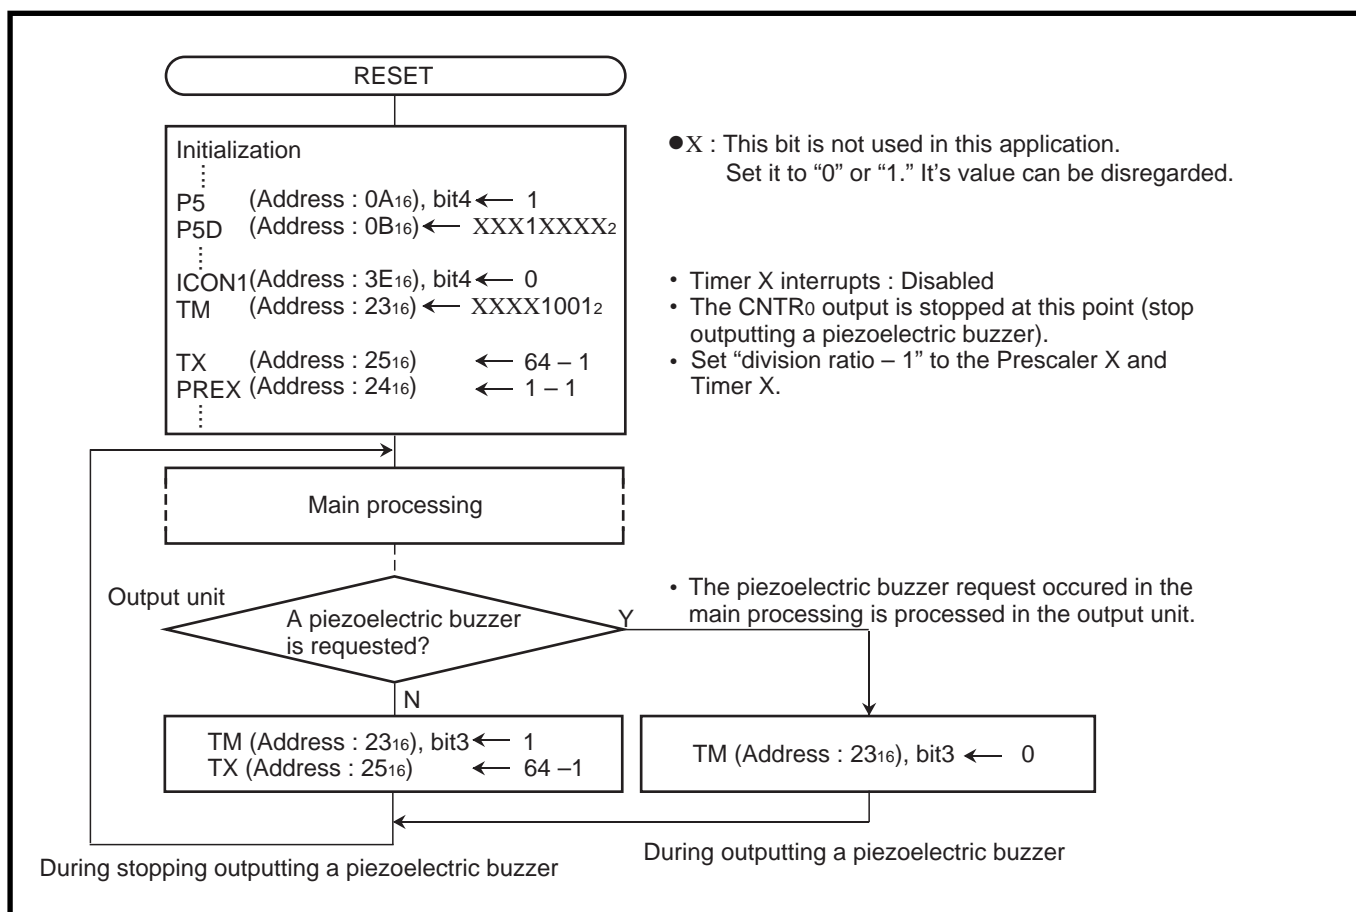

Fig. 2.2.16 Control procedure [Piezoelectric buzzer output]

(4) Timer application example 3 : Measurement of frequency

Outline : The following two values are compared for judging if the frequency is within a certain range.

- A value counted a pulse which is input to P55/CNTR1 pin by a timer.
- A reference value

- Specifications :**
- The pulse is input to the P55/CNTR1 pin and counted by the Timer Y.
 - A count value is read out at the interval of about 2 ms (Timer 1 interrupt interval : $244 \mu\text{s} \times 8$). When the count value is 28 to 40, it is regarded the input pulse as a valid.
 - Because the timer is a down-counter, the count value is compared with 227 to 215*.
* $227 \text{ to } 215 = 255 \text{ (initialized value of counter)} - 28 \text{ to } 40 \text{ (the number of valid value)}$.

Figure 2.2.17 shows a method for judging if input pulse exists, and Figure 2.2.18 shows a setting of related registers.

APPLICATION

2.2 Timer

(5) Timer application example 4 : Measurement of pulse width of FG pulse generated by motor

Outline : The “H” level width of a pulse input to the P54/CNTR0 pin is counted by Timer X. An underflow is detected by Timer X interrupt and an end of the input pulse “H” level is detected by CNTR0 interrupt.

Specifications : • The “H” level width of a FG pulse input to the P54/CNTR0 pin is counted by Timer X. (Example : When the clock frequency is 4.19 MHz, the count source would be $3.8 \mu\text{s}$ that is obtained by dividing the clock frequency by 16. Measurement can be made up to 250 ms in the range of FFFF_{16} to 0000_{16} .)

Figure 2.2.20 shows a connection of the timer and a setting of the division ration, and Figure 2.2.21 shows a setting of related registers.

APPLICATION

2.3 Serial I/O

2.3.4 Setting of serial I/O transfer data format

A clock synchronous or clock asynchronous (UART) is selected as a data format of the serial I/O1. The serial I/O2 operates in a clock synchronous.

Figure 2.3.16 shows a setting of serial I/O transfer data format.

Fig. 2.3.16 Setting of Serial I/O transfer data format

2.3.5 Serial I/O application examples

(1) Communication using a clock synchronous serial I/O (transmit/receive)

Outline : 2-byte data is transmitted and received through the clock synchronous serial I/O. The $\overline{\text{SRDY}}$ signal is used for communication control.

Figure 2.3.17 shows a connection diagram, and Figure 2.3.18 shows a timing chart.

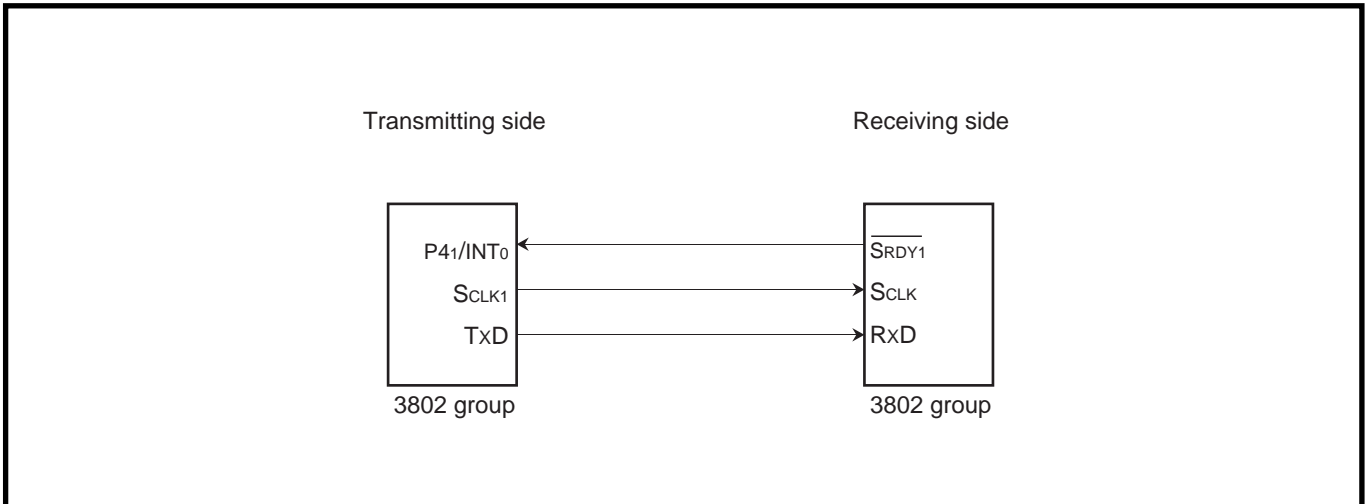

Fig. 2.3.17 Connection diagram [Communication using a clock synchronous serial I/O]

- Specifications :**
- The Serial I/O1 is used (clock synchronous serial I/O is selected)
 - Synchronous clock frequency : 125 kHz ($f(\text{XIN}) = 4 \text{ MHz}$ is divided by 32)
 - The $\overline{\text{SRDY1}}$ (receivable signal) is used.
 - The receiving side outputs the $\overline{\text{SRDY1}}$ signal at intervals of 2 ms (generated by timer), and 2-byte data is transferred from the transmitting side to the receiving side.

Fig. 2.3.18 Timing chart [Communication using a clock synchronous serial I/O]

APPLICATION

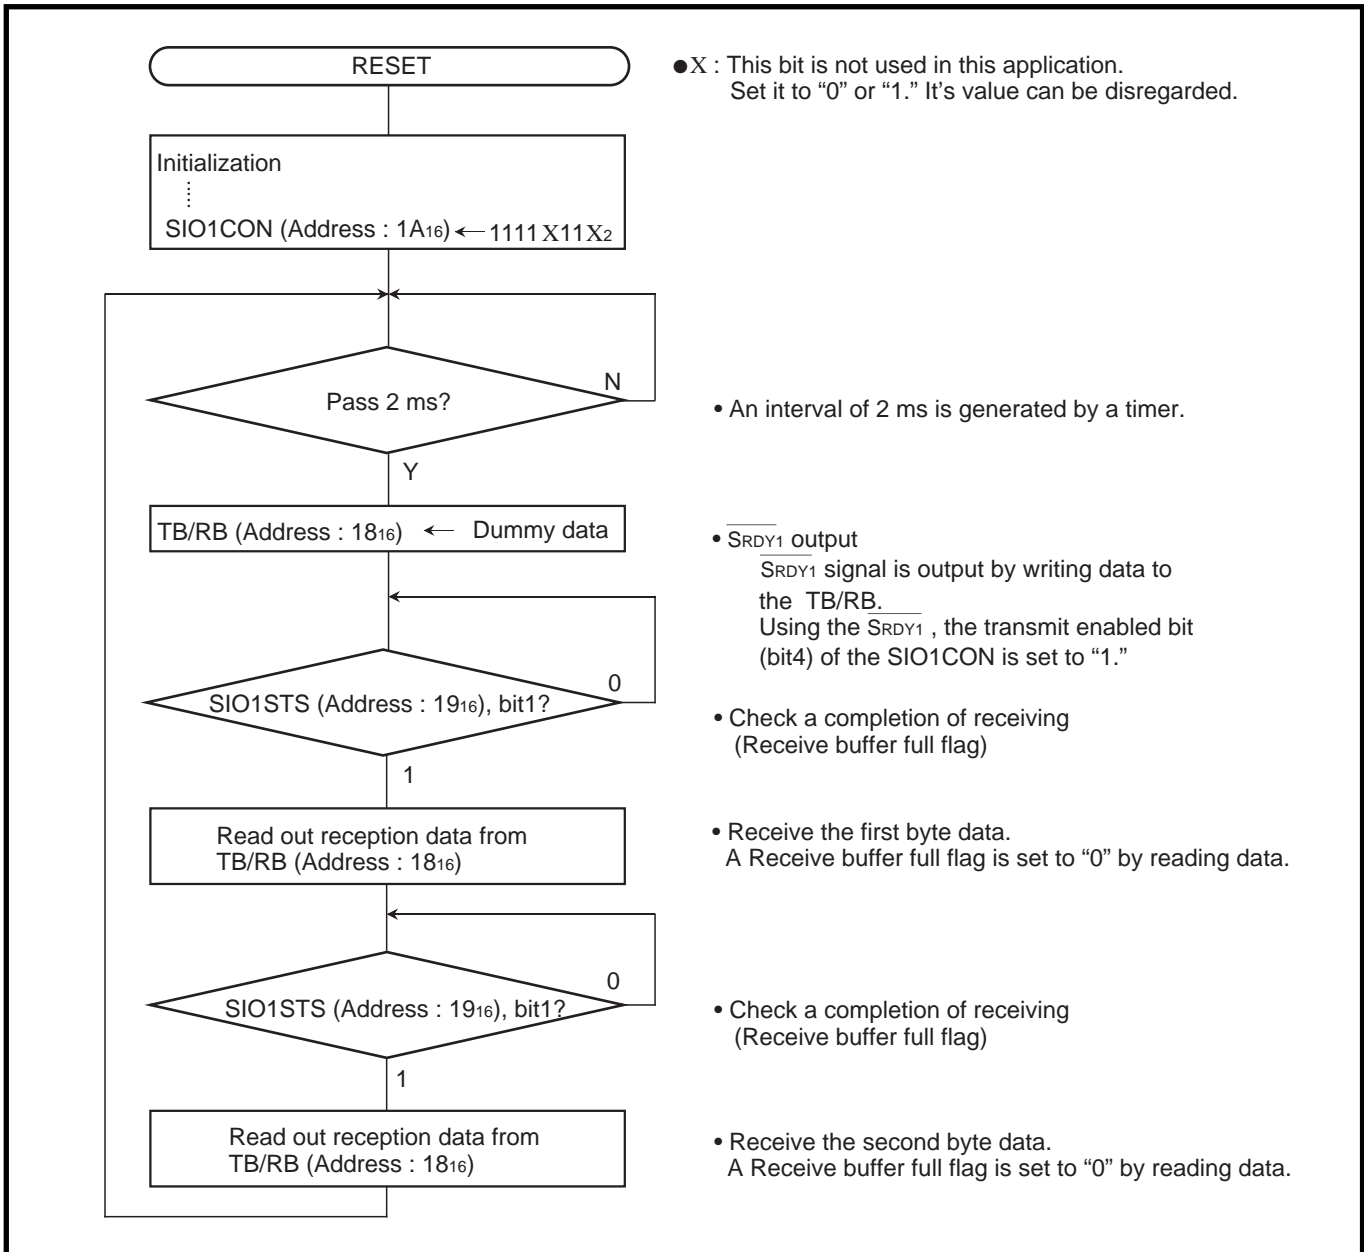

Fig. 2.3.22 Control procedure at a receiving side [Communication using a clock synchronous serial I/O]

APPLICATION

2.3 Serial I/O

(2) Output of serial data (control of a peripheral IC)

Outline : 4-byte data is transmitted and received through the clock synchronous serial I/O. The CS signal is output to a peripheral IC through the port P53.

Fig. 2.3.23 Connection diagram [Output of serial data]

- Specifications :**
- The Serial I/O is used. (clock synchronous serial I/O is selected)
 - Synchronous clock frequency : 125 kHz ($f(X_{IN}) = 4 \text{ MHz}$ is divided by 32)
 - Transfer direction : LSB first
 - The Serial I/O interrupt is not used.
 - The Port P53 is connected to the \overline{CS} pin ("L" active) of the peripheral IC for a transmission control (the output level of the port P53 is controlled by software).

Figure 2.3.24 shows an output timing chart of serial data.

Fig. 2.3.24 Timing chart [Output of serial data]

Figure 2.3.25 shows a setting of serial I/O1 related registers, and Figure 2.3.26 shows a setting of serial I/O1 transmission data.

Fig. 2.3.25 Setting of serial I/O1 related registers [Output of serial data]

Fig. 2.3.26 Setting of serial I/O1 transmission data [Output of serial data]

APPLICATION

2.3 Serial I/O

Control procedure : When the registers are set as shown in Fig. 2.3.25, the Serial I/O1 can transmit 1-byte data simply by writing data to the Transmit buffer register. Thus, after setting the CS signal to “L,” write the transmission data to the Receive buffer register on a 1-byte base, and return the CS signal to “H” when the desired number of bytes have been transmitted. Figure 2.3.27 shows a control procedure of serial I/O1.

Fig. 2.3.27 Control procedure of serial I/O1 [Output of serial data]

Figure 2.3.28 shows a setting of serial I/O2 related registers, and Figure 2.3.29 shows a setting of serial I/O2 transmission data.

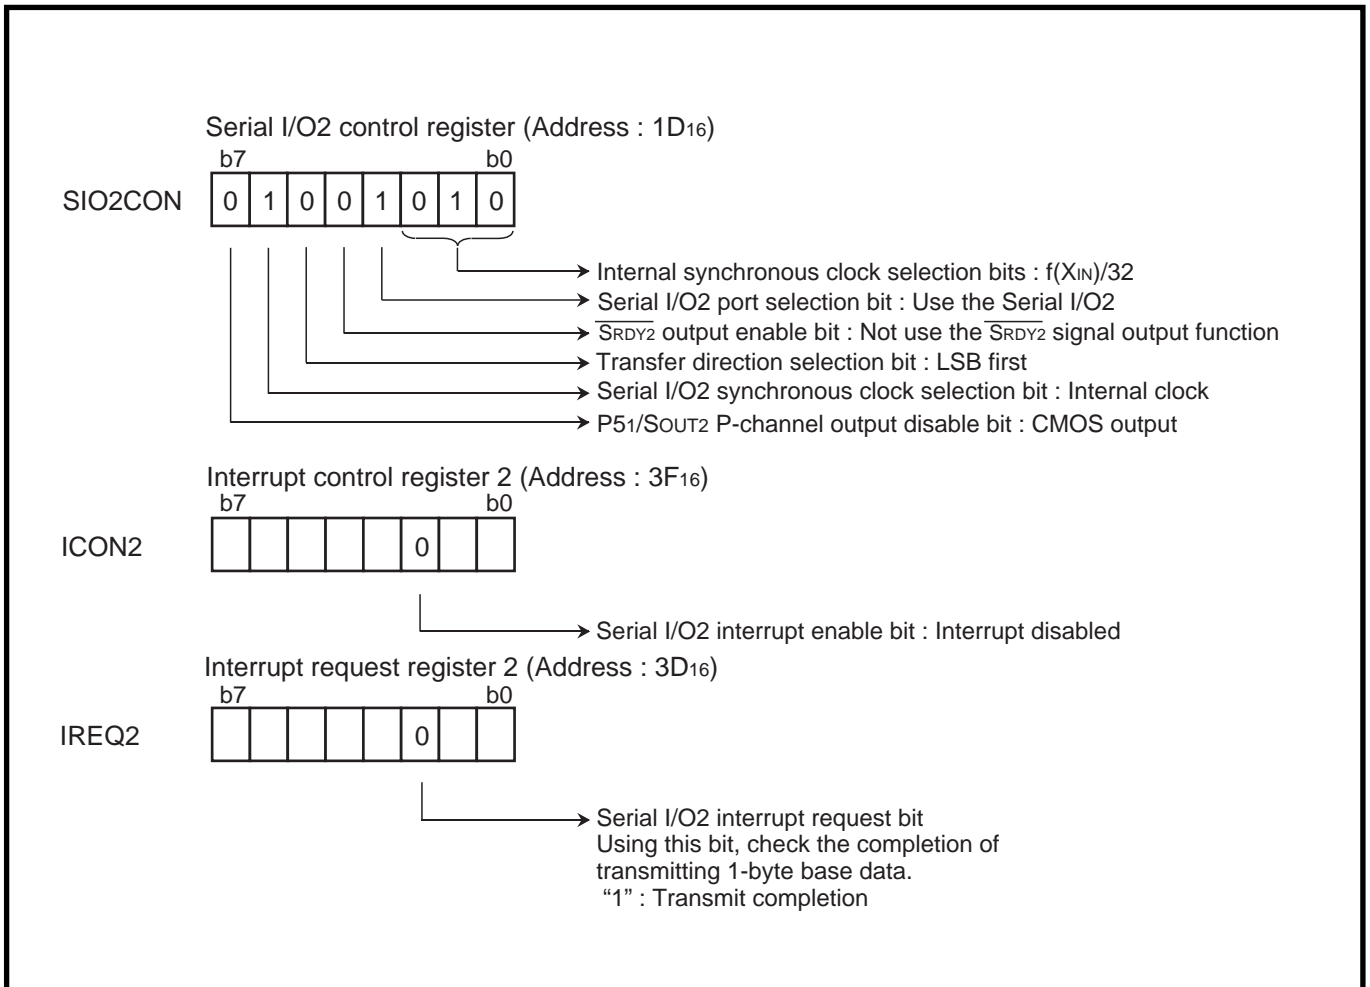

Fig. 2.3.28 Setting of serial I/O2 related registers [Output of serial data]

Fig. 2.3.29 Setting of serial I/O2 transmission data [Output of serial data]

APPLICATION

2.3 Serial I/O

Control procedure : When the registers are set as shown in Fig. 2.3.28, the Serial I/O2 can transmit 1-byte data simply by writing data to the Serial I/O2 register. Thus, after setting the CS signal to “L,” write the transmission data to the Serial I/O1 register on a 1-byte base, and return the CS signal to “H” when the desired number of bytes have been transmitted.

Figure 2.3.30 shows a control procedure of serial I/O2.

Fig. 2.3.30 Control procedure of serial I/O2 [Output of serial data]

(3) Cyclic transmission or reception of block data (data of a specified number of bytes) between microcomputers [without using an automatic transfer]

Outline : When a clock synchronous serial I/O is used for communication, synchronization of the clock and the data between the transmitting and receiving sides may be lost because of noise included in the synchronizing clock. Thus, it is necessary to be corrected constantly. This “heading adjustment” is carried out by using the interval between blocks in this example.

Fig. 2.3.31 Connection diagram [Cyclic transmission or reception of block data between microcomputers]

- Specifications :**
- The serial I/O1 is used (clock synchronous serial I/O is selected).
 - Synchronous clock frequency : 131 kHz ($f(XIN) = 4.19 \text{ MHz}$ is divided by 32)
 - Byte cycle: 488 μs
 - Number of bytes for transmission or reception : 8 byte/block
 - Block transfer cycle : 16 ms
 - Block transfer period : 3.5 ms
 - Interval between blocks : 12.5 ms
 - Heading adjustive time : 8 ms

Limitations of the specifications

1. Reading of the reception data and setting of the next transmission data must be completed within the time obtained from “byte cycle – time for transferring 1-byte data” (in this example, the time taken from generating of the Serial I/O1 receive interrupt request to generating of the next synchronizing clock is 431 μs).
2. “Heading adjustive time < interval between blocks” must be satisfied.

APPLICATION

2.3 Serial I/O

The communication is performed according to the timing shown below. In the slave unit, when a synchronizing clock is not input within a certain time (heading adjustive time), the next clock input is processed as the beginning (heading) of a block.

When a clock is input again after one block (8 byte) is received, the clock is ignored.

Figure 2.3.33 shows a setting of related registers.

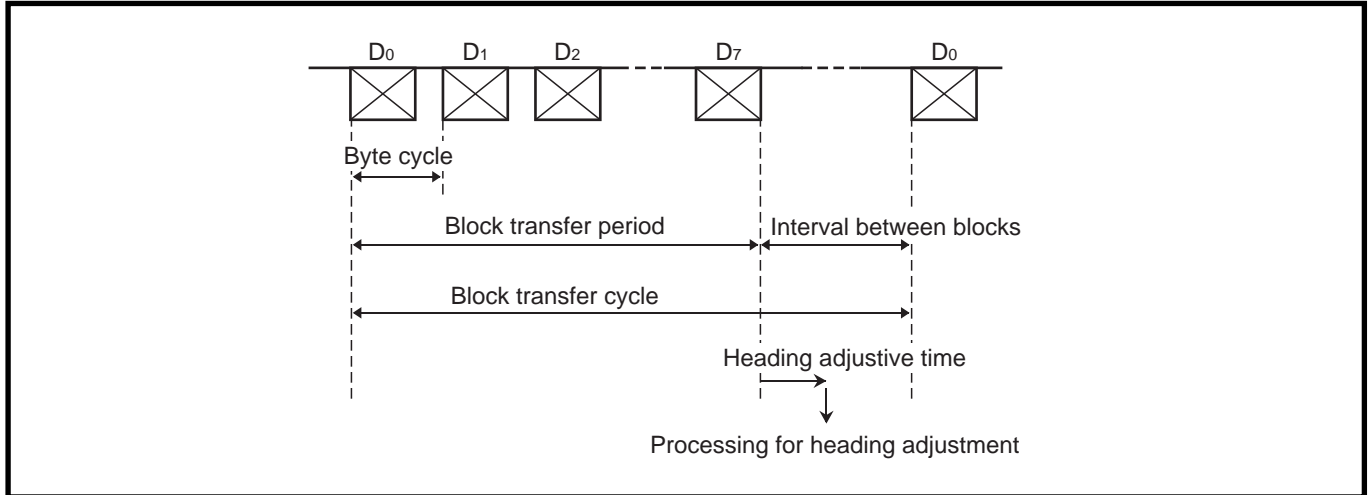

Fig. 2.3.32 Timing chart [Cyclic transmission or reception of block data between microcomputers]

Fig. 2.3.33 Setting of related registers [Cyclic transmission or reception of block data between microcomputers]

Control procedure :

① Control in the master unit

After a setting of the related registers is completed as shown in Figure 2.3.33, in the master unit transmission or reception of 1-byte data is started simply by writing transmission data to the Transmit buffer register.

To perform the communication in the timing shown in Figure 2.3.32, therefore, take the timing into account and write transmission data. Read out the reception data when the Serial I/O1 transmit interrupt request bit is set to "1," or before the next transmission data is written to the Transmit buffer register.

A processing example in the master unit using timer interrupts is shown below.

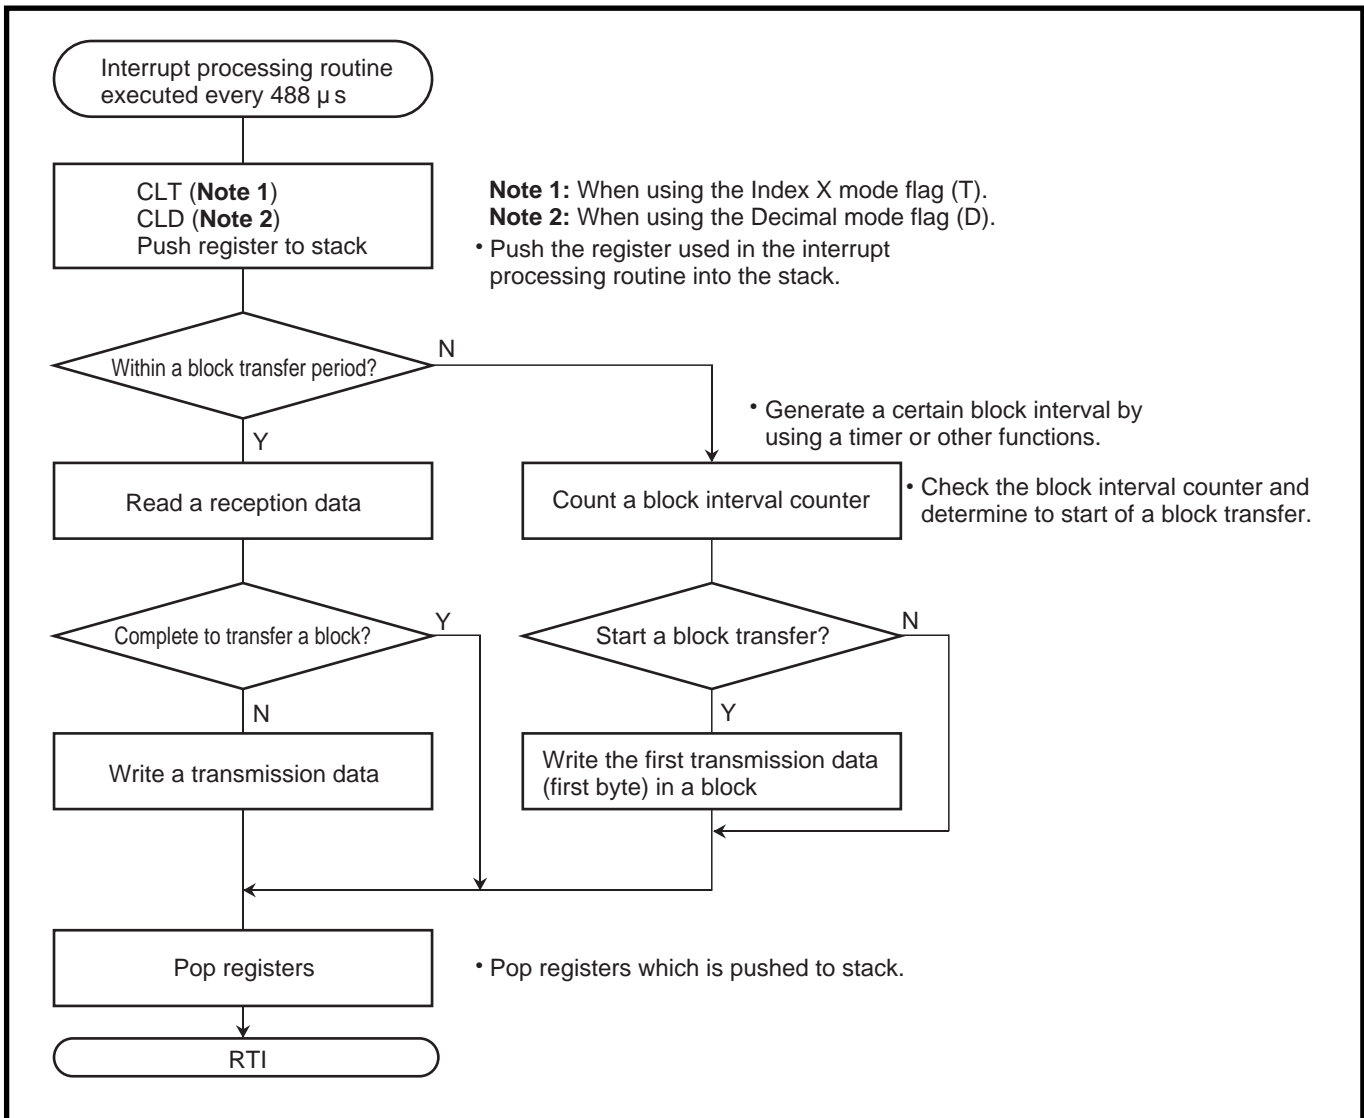

Fig. 2.3.34 Control in the master unit

APPLICATION

2.3 Serial I/O

②Control in the slave unit

After a setting of the related registers is completed as shown in Figure 2.3.33, the slave unit becomes the state which is received a synchronizing clock at all times, and the Serial I/O1 receive interrupt request bit is set to "1" every time an 8-bit synchronous clock is received.

By the serial I/O1 receive interrupt processing routine, the data to be transmitted next is written to the Transmit buffer register after received data is read out.

However, if no serial I/O1 receive interrupt occurs for more than a certain time (head adjustive time), the following processing will be performed.

1. The first 1 byte data of the transmission data in the block is written into the Transmit buffer register.
2. The data to be received next is processed as the first 1 byte of the received data in the block.

Figure 2.3.35 shows the control in the slave unit using a serial I/O1 receive interrupt and any timer interrupt (for head adjustive).

Fig. 2.3.35 Control in the slave unit

(4) Communication (transmit/receive) using an asynchronous serial I/O (UART)

Point : 2-byte data is transmitted and received through an asynchronous serial I/O.

The port P40 is used for communication control.

Figure 2.3.36 shows a connection diagram, and Figure 2.3.37 shows a timing chart.

Fig. 2.3.36 Connection diagram [Communication using UART]

- Specifications :**
- The Serial I/O1 is used (UART is selected).
 - Transfer bit rate : 9600 bps ($f(XIN) = 4.9152 \text{ MHz}$ is divided by 512)
 - Communication control using port P40
(The output level of the port P40 is controlled by software.)
 - 2-byte data is transferred from the transmitting side to the receiving side at intervals of 10 ms (generated by timer).

Fig. 2.3.37 Timing chart [Communication using UART]

APPLICATION

2.3 Serial I/O

Table 2.3.1 shows setting examples of Baud rate generator (BRG) values and transfer bit rate values, Figure 2.3.38 shows a setting of related registers at a transmitting side, and Figure 2.3.39 shows a setting of related registers at a receiving side.

Table 2.3.1 Setting examples of Baud rate generator values and transfer bit rate values

Transfer bit rate (bps) (Note 1)	BRG count source (Note 2)	at f(XIN) = 4.9152 MHz		at f(XIN) = 7.3728 MHz		at f(XIN) = 8 MHz	
		BRG setting value	Actual time (bps)	BRG setting value	Actual time (bps)	BRG setting value	Actual time (bps)
600	f(XIN)/4	127(7F ₁₆)	600.00	191(BF ₁₆)	600.00	207(CF ₁₆)	600.96
1200	f(XIN)/4	63(3F ₁₆)	1200.00	95(5F ₁₆)	1200.00	103(67 ₁₆)	1201.92
2400	f(XIN)/4	31(1F ₁₆)	2400.00	47(2F ₁₆)	2400.00	51(33 ₁₆)	2403.85
4800	f(XIN)/4	15(0F ₁₆)	4800.00	23(17 ₁₆)	4800.00	25(19 ₁₆)	4807.69
9600	f(XIN)/4	7(07 ₁₆)	9600.00	11(0B ₁₆)	9600.00	12(0C ₁₆)	9615.38
19200	f(XIN)/4	3(03 ₁₆)	19200.00	5(05 ₁₆)	19200.00	5(05 ₁₆)	20833.33
38400	f(XIN)/4	1(01 ₁₆)	38400.00	2(02 ₁₆)	38400.00	2(02 ₁₆)	41666.67
76800	f(XIN)	3(03 ₁₆)	76800.00	5(05 ₁₆)	76800.00	5(05 ₁₆)	83333.33
31250	f(XIN)	————	————	————	————	15(0F ₁₆)	31250.00
62500	f(XIN)	————	————	————	————	7(07 ₁₆)	62500.00

Notes 1: Equation of transfer bit rate

$$\text{Transfer bit rate (bps)} = \frac{f(\text{XIN})}{(\text{BRG setting value} + 1) \times 16 \times m}$$

m: when bit 0 of the Serial I/O1 control register (Address : 1A₁₆) is set to “0,” a value of m is 1.

when bit 0 of the Serial I/O1 control register (Address : 1A₁₆) is set to “1,” a value of m is 4.

2: A BRG count source is selected by bit 0 of the Serial I/O1 control register (Address : 1A₁₆).

Transmitting side

* when bit 0 of the Serial I/O1 control register (Address : 1A₁₆) is set to "0," a value of m is 1.
 when bit 0 of the Serial I/O1 control register (Address : 1A₁₆) is set to "1," a value of m is 4.

Fig. 2.4.7 Setting of related registers

[About PWM output]

- Set the PWM function enable bit to "1" : The P5₆/PWM pin is used as the PWM pin. "H" level pulse is output first.
- Set the PWM function enable bit to "0" : The P5₆/PWM pin is used as the port P5₆. Thus, when fixing the output level, make sure the following.
 - First, write an output value to bit 6 of the Port P5 register.
 - Then write "X1XXXXXX2" to the Port P5 direction register. (X : This bit is not used in this application. Set it to "0" or "1." It's value can be disregarded.)
- After data is set to the PWM prescaler and the PWM register, the PWM waveforms corresponding to new data will be output from the next repetitive cycle.

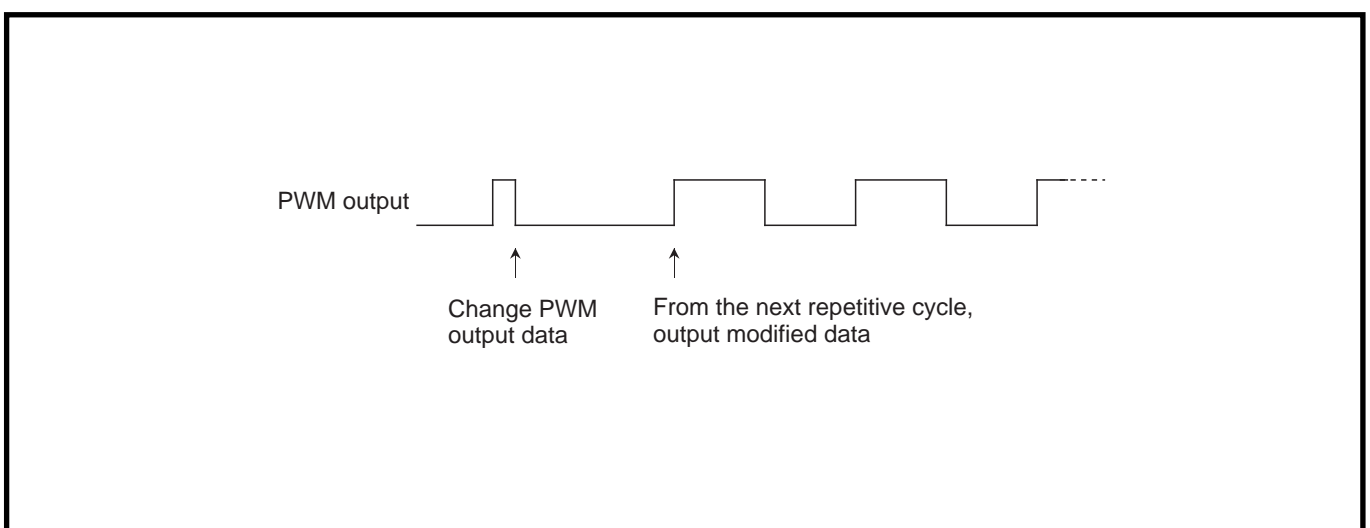

Fig. 2.4.8 PWM output

APPLICATION

2.4 PWM

Control procedure : By setting the related registers as shown to Figure 2.4.7, PWM waveforms are output to the external unit. This PWM output is integrated through the low pass filter and converted into DC signals for control of the motor.

Figure 2.4.9 shows control procedure.

Fig. 2.4.9 Control procedure

Conversion of Analog input voltage

Outline : The analog input voltage input from the sensor is converted into digital values.

Figure 2.5.6 shows a connection diagram, and Figure 2.5.7 shows a setting of related registers.

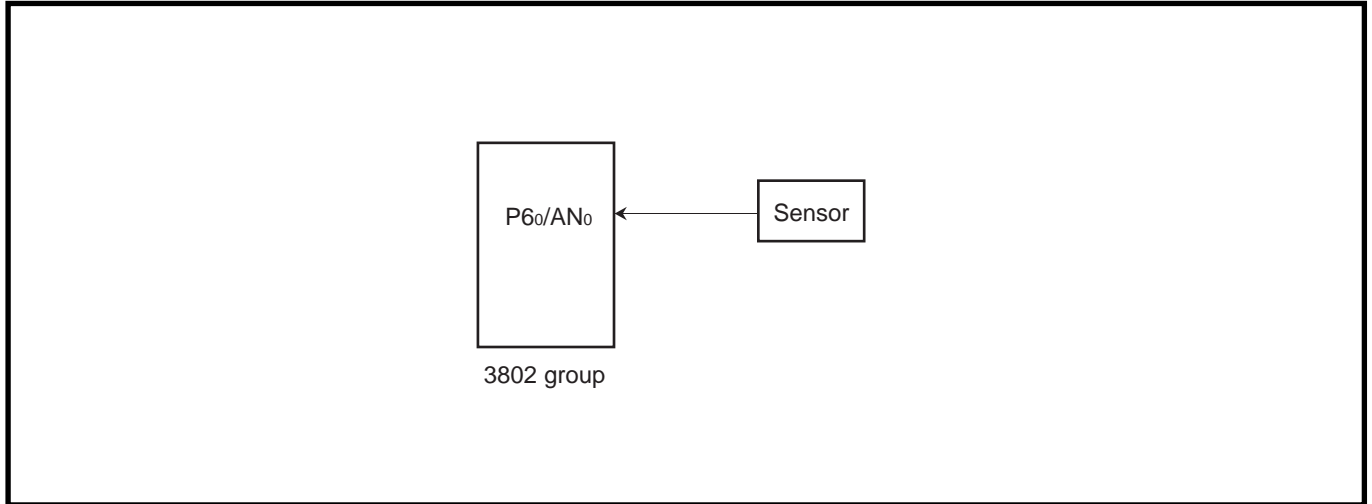

Fig. 2.5.6 Connection diagram [Conversion of Analog input voltage]

- Specifications :**
- The analog input voltage input from the sensor is converted into digital values.
 - The P6₀/AN₀ pin is used as an analog input pin.

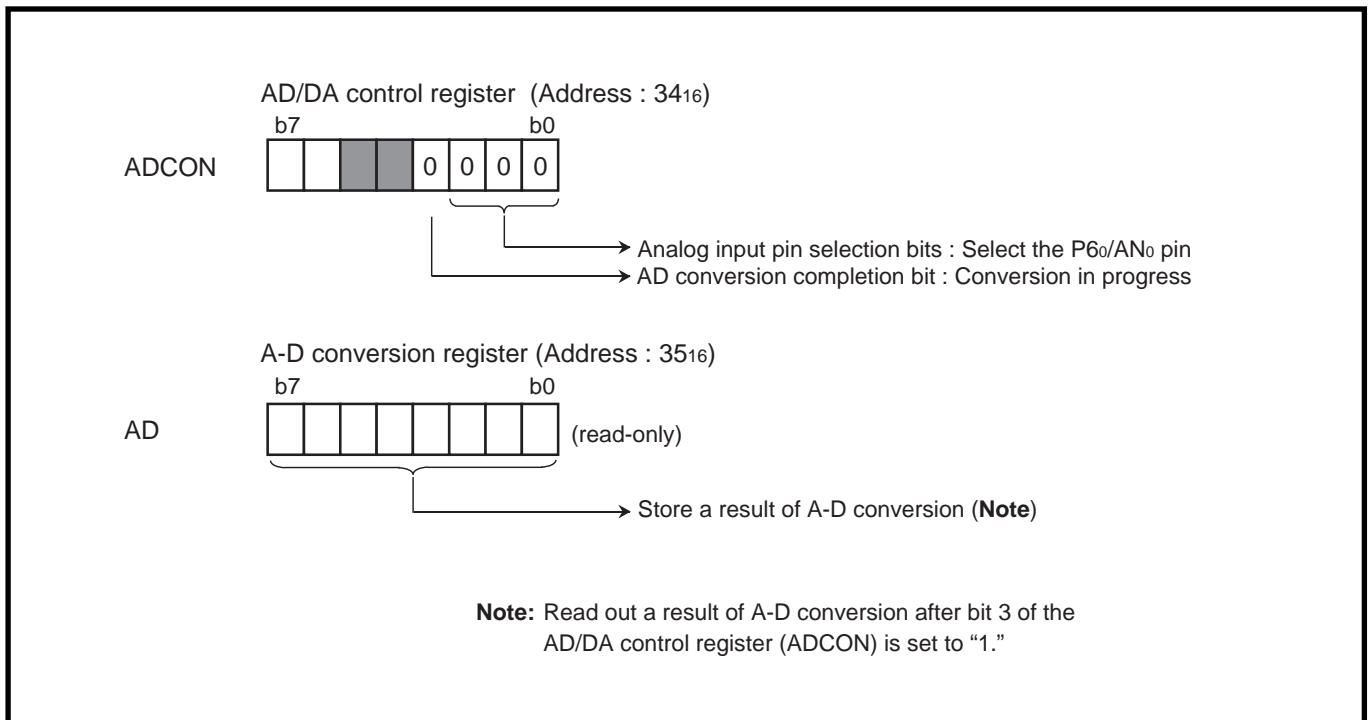

Fig. 2.5.7 Setting of related registers [Conversion of Analog input voltage]

Control procedure : By setting the related registers as shown in Figure 2.5.7, the analog input voltage input from the sensor are converted into digital values.

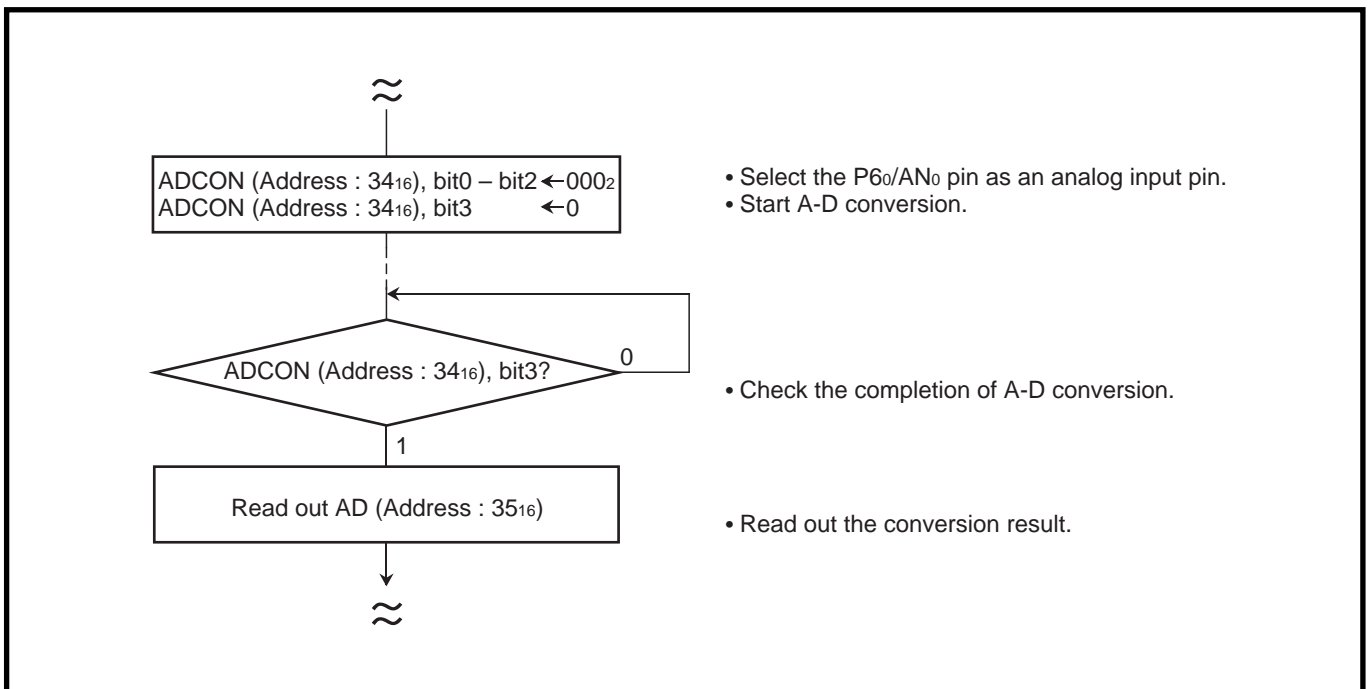

Fig. 2.5.8 Control procedure [Conversion of Analog input voltage]

APPLICATION

Fig. 2.6.2 Structure of CPU mode register

2.6.3 Processor mode application examples

(1) Application example of memory expansion in the case where the \overline{ONW} (One-Wait) function is not used

Outline : The external memory is accessed in the microprocessor mode.

At $f(X_{IN}) = 8 \text{ MHz}$, an available RAM is given by the following :

- \overline{OE} access time : $t_a (\text{OE}) \leq 50 \text{ ns}$
- Setup time for writing data : $t_{su} (\text{D}) \leq 65 \text{ ns}$

For example, the M5M5256BP-10 whose address access is 100 ns is available.

Figure 2.6.3 shows an expansion example of a 32K byte ROM and a 32K byte RAM.

Fig. 2.6.3 Expansion example of ROM and RAM

APPLICATION

2.6 Processor mode

Figure 2.6.4, Figure 2.6.5 and Figure 2.6.6 show a standard timing at 8 MHz (No-Wait).

Fig. 2.6.4 Read-cycle (OE access, SRAM)

Fig. 2.6.5 Read-cycle (OE access, EPROM)

Fig. 2.6.6 Write-cycle (W control, SRAM)

APPLICATION

2.6 Processor mode

(2) Application example of memory expansion in the case where the $\overline{\text{ONW}}$ (One-Wait) function is used

Outline : $\overline{\text{ONW}}$ function is used when the external memory access is slow.

If "L" level signal is input to the P32/ $\overline{\text{ONW}}$ pin while the CPU is in the read or write status, the read or write cycle corresponding to 1 cycle of ϕ is extended. In the extended period, the $\overline{\text{RD}}$ or $\overline{\text{WR}}$ signal is kept at the "L" level. The $\overline{\text{ONW}}$ function operates only when data is read from or written into addresses 0000₁₆ to 0007₁₆ and addresses 0440₁₆ to FFFF₁₆.

Figure 2.6.7 shows an application example of the $\overline{\text{ONW}}$ function.

Fig. 2.6.7 Application example of the $\overline{\text{ONW}}$ function

APPENDIX

3.1 Electrical characteristics

3.1 Electrical characteristics

3.1.1 ABSOLUTE MAXIMUM RATINGS

Table 3.1.1 Absolute maximum ratings

Symbol	Parameter	Conditions	Ratings	Unit
V _{CC}	Power source voltage	All voltages are based on V _{SS} . Output transistors are cut off.	-0.3 to 7.0	V
V _I	Input voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67, V _{REF}		-0.3 to V _{CC} +0.3	V
V _I	Input voltage $\overline{\text{RESET}}$, X _{IN}		-0.3 to V _{CC} +0.3	V
V _I	Input voltage CNV _{SS}		-0.3 to 13	V
V _O	Output voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67, X _{OUT}		-0.3 to V _{CC} +0.3	V
P _d	Power dissipation	T _a = 25 °C	1000 (Note)	mW
T _{opr}	Operating temperature		-20 to 85	°C
T _{stg}	Storage temperature		-40 to 125	°C

Note: 300 mW in case of the flat package.

3.1.2 Recommended operating conditions

Table 3.1.2 RECOMMENDED OPERATING CONDITIONS (V_{CC} = 3.0 to 5.5 V, T_a = -20 to 85°C, unless otherwise noted)

Symbol	Parameter		Limits			Unit
			Min.	Typ.	Max.	
V _{CC}	Power source voltage (f(X _{IN}) < 2 MHz) (Note 1)		3.0	5.0	5.5	V
	Power source voltage (f(X _{IN}) = 8 MHz) (Note 1)		4.0	5.0	5.5	
V _{SS}	Power source voltage			0		V
V _{REF}	Analog reference voltage (when A-D converter is used)		2.0		V _{CC}	V
	Analog reference voltage (when D-A converter is used)		3.0		V _{CC}	
AV _{SS}	Analog power source voltage			0		V
V _{IA}	Analog input voltage	AN0–AN7	AV _{SS}		V _{CC}	V
V _{IH}	"H" input voltage	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	0.8 V _{CC}		V _{CC}	V
V _{IH}	"H" input voltage	$\overline{\text{RESET}}$, X _{IN} , CNV _{SS}	0.8 V _{CC}		V _{CC}	V
V _{IL}	"L" input voltage	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	0		0.2 V _{CC}	V
V _{IL}	"L" input voltage	$\overline{\text{RESET}}$, CNV _{SS}	0		0.2 V _{CC}	V
V _{IL}	"L" input voltage	X _{IN}	0		0.16 V _{CC}	V
ΣI _{OH(peak)}	"H" total peak output current	P00–P07, P10–P17, P20–P27, P30–P37 (Note 2)			-80	mA
ΣI _{OH(peak)}	"H" total peak output current	P40–P47, P50–P57, P60–P67 (Note 2)			-80	mA
ΣI _{OL(peak)}	"L" total peak output current	P00–P07, P10–P17, P20–P27, P30–P37 (Note 2)			80	mA
ΣI _{OL(peak)}	"L" total peak output current	P40–P47, P50–P57, P60–P67 (Note 2)			80	mA
ΣI _{OH(avg)}	"H" total average output current	P00–P07, P10–P17, P20–P27, P30–P37 (Note 2)			-40	mA
ΣI _{OH(avg)}	"H" total average output current	P40–P47, P50–P57, P60–P67 (Note 2)			-40	mA
ΣI _{OL(avg)}	"L" total average output current	P00–P07, P10–P17, P20–P27, P30–P37 (Note 2)			40	mA
ΣI _{OL(avg)}	"L" total average output current	P40–P47, P50–P57, P60–P67 (Note 2)			40	mA
I _{OH(peak)}	"H" peak output current	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 3)			-10	mA
I _{OL(peak)}	"L" peak output current	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 3)			10	mA
I _{OH(avg)}	"H" average output current	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 4)			-5	mA
I _{OL(avg)}	"L" average output current	P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 4)			5	mA
f(X _{IN})	Internal clock oscillation frequency (V _{CC} = 4.0 to 5.5 V)				8	MHz
	Internal clock oscillation frequency (V _{CC} = 3.0 to 4.0 V)				6 V _{CC} -16	

Note 1: The total output current is the sum of all the currents flowing through all the applicable ports. The total average current is an average value measured over 100 ms. The total peak current is the peak value of all the currents.

2: The peak output current is the peak current flowing in each port.

3: The average output current I_{OL(avg)}, I_{OH(avg)} in an average value measured over 100 ms.

3.1 Electrical characteristics

3.1.3 Electrical characteristics

Table 3.1.3 ELECTRICAL CHARACTERISTICS ($V_{CC} = 3.0$ to 5.5 V, $V_{SS} = 0$ V, $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
VOH	“H” output voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 1)	$I_{OH} = -10$ mA $V_{CC} = 4.0$ to 5.5 V	$V_{CC}-2.0$			V
		$I_{OH} = -1.0$ mA $V_{CC} = 3.0$ to 5.5 V	$V_{CC}-1.0$			
VOL	“L” output voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	$I_{OL} = 10$ mA $V_{CC} = 4.0$ to 5.5 V			2.0	V
		$I_{OL} = 1.0$ mA $V_{CC} = 3.0$ to 5.5 V			1.0	
VT+ – VT–	Hysteresis CNTR0, CNTR1, INT0–INT4			0.4		V
VT+ – VT–	Hysteresis RXD, SCLK1, SIN2, SCLK2			0.5		V
VT+ – VT–	Hysteresis \overline{RESET}			0.5		V
IiH	“H” input current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	$V_i = V_{CC}$			5.0	μ A
IiH	“H” input current \overline{RESET} , CNVss	$V_i = V_{CC}$			5.0	μ A
IiH	“H” input current XIN	$V_i = V_{CC}$		4		μ A
IiL	“L” input current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67, \overline{RESET} , CNVss	$V_i = V_{SS}$			-5.0	μ A
IiL	“L” input current \overline{RESET} , CNVss	$V_i = V_{SS}$			-5.0	μ A
IiL	“L” input current XIN	$V_i = V_{SS}$		-4		μ A
VRAM	RAM hold voltage	When clock stopped	2.0		5.5	V
ICC	Power source current	$f(X_{IN}) = 8$ MHz, $V_{CC} = 5$ V		6.4	13	mA
		$f(X_{IN}) = 5$ MHz, $V_{CC} = 5$ V		4	8	
		$f(X_{IN}) = 2$ MHz, $V_{CC} = 3$ V		0.8	2.0	
		When WIT instruction is executed with $f(X_{IN}) = 8$ MHz, $V_{CC} = 5$ V		1.5		
		When WIT instruction is executed with $f(X_{IN}) = 5$ MHz, $V_{CC} = 5$ V		1		
		When WIT instruction is executed with $f(X_{IN}) = 2$ MHz, $V_{CC} = 3$ V		0.2		
		When STP instruction is executed with clock stopped, output transistors isolated.	$T_a = 25$ °C (Note 2) $T_a = 85$ °C (Note 2)		0.1	1
					10	

Note 1: P45 is measured when the P45/TXD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is “0”.

P51 is measured when the P51/SOUT2 P-channel output disable bit of the serial I/O2 control register (bit 7 of address 001D16) is “0”.

2: With output transistors isolated and A-D converter having completed conversion, and not including current flowing through VREF pin.

3.1.4 A-D converter characteristics

Table 3.1.4 A–D CONVERTER CHARACTERISTICS

($V_{CC} = 3.0$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V, $V_{REF} = 2.0$ V to V_{CC} , $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
—	Resolution				8	Bits
—	Absolute accuracy (excluding quantization error)			± 1	± 2.5	LSB
tCONV	Conversion time				50	tc(ϕ)
RLADDER	Ladder resistor			35		k Ω
IVREF	Reference power source input current (Note)	$V_{REF} = 5.0$ V	50	150	200	μ A
Ii(AD)	A-D port input current			0.5	5.0	μ A

Note: When D-A conversion registers (addresses 003616 and 003716) contain “0016”.

APPENDIX

3.1 Electrical characteristics

3.1.5 D-A CONVERTER CHARACTERISTICS

Table 3.1.5 D-A CONVERTER CHARACTERISTICS

(VCC = 3.0 to 5.5 V, VSS = AVSS = 0 V, VREF = 3.0 V to VCC, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
—	Resolution				8	Bits
—	Absolute accuracy	VCC = 4.0 to 5.5 V			1.0	%
		VCC = 3.0 to 4.0 V			2.5	
tsu	Setting time				3	μs
RO	Output resistor		1	2.5	4	kΩ
IVREF	Reference power source input current (Note)				3.2	mA

Note: Using one D-A converter, with the value in the D-A conversion register of the other D-A converter being "0016", and excluding currents flowing through the A-D resistance ladder.

3.1 Electrical characteristics

3.1.6 Timing requirements and Switching characteristics

Table 3.1.6 TIMING REQUIREMENTS (1) ($V_{CC} = 4.0$ to 5.5 V, $V_{SS} = 0$ V, $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$t_w(\overline{RESET})$	Reset input "L" pulse width	2			μs
$t_c(X_{IN})$	External clock input cycle time	125			ns
$t_{wH}(X_{IN})$	External clock input "H" pulse width	50			ns
$t_{wL}(X_{IN})$	External clock input "L" pulse width	50			ns
$t_c(CNTR)$	CNTR0, CNTR1 input cycle time	200			ns
$t_{wH}(CNTR)$	CNTR0, CNTR1 input "H" pulse width	80			ns
$t_{wH}(INT)$	INT0 to INT4 input "H" pulse width	80			ns
$t_{wL}(CNTR)$	CNTR0, CNTR1 input "L" pulse width	80			ns
$t_{wL}(INT)$	INT0 to INT4 input "L" pulse width	80			ns
$t_c(SCLK1)$	Serial I/O1 clock input cycle time (Note)	800			ns
$t_c(SCLK2)$	Serial I/O2 clock input cycle time	1000			ns
$t_{wH}(SCLK1)$	Serial I/O1 clock input "H" pulse width (Note)	370			ns
$t_{wH}(SCLK2)$	Serial I/O2 clock input "H" pulse width	400			ns
$t_{wL}(SCLK1)$	Serial I/O1 clock input "L" pulse width (Note)	370			ns
$t_{wL}(SCLK2)$	Serial I/O2 clock input "L" pulse width	400			ns
$t_{su}(RXD-SCLK1)$	Serial I/O1 input set up time	220			ns
$t_{su}(SIN2-SCLK2)$	Serial I/O2 input set up time	200			ns
$t_h(SCLK1-RXD)$	Serial I/O1 input hold time	100			ns
$t_h(SCLK2-SIN2)$	Serial I/O2 input hold time	200			ns

Note: When $f(X_{IN}) = 8$ MHz and bit 6 of address 001A16 is "1". Divide this value by four when $f(X_{IN}) = 8$ MHz and bit 6 of address 001A16 is "0".

Table 3.1.7 TIMING REQUIREMENTS (2) ($V_{CC} = 3.0$ to 5.5 V, $V_{SS} = 0$ V, $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$t_w(\overline{RESET})$	Reset input "L" pulse width	2			μs
$t_c(X_{IN})$	External clock input cycle time	500/ (3 $V_{CC}-8$)			ns
$t_{wH}(X_{IN})$	External clock input "H" pulse width	200/ (3 $V_{CC}-8$)			ns
$t_{wL}(X_{IN})$	External clock input "L" pulse width	200/ (3 $V_{CC}-8$)			ns
$t_c(CNTR)$	CNTR0, CNTR1 input cycle time	500			ns
$t_{wH}(CNTR)$	CNTR0, CNTR1 input "H" pulse width	230			ns
$t_{wH}(INT)$	INT0 to INT4 input "H" pulse width	230			ns
$t_{wL}(CNTR)$	CNTR0, CNTR1 input "L" pulse width	230			ns
$t_{wL}(INT)$	INT0 to INT4 input "L" pulse width	230			ns
$t_c(SCLK1)$	Serial I/O1 clock input cycle time (Note)	2000			ns
$t_c(SCLK2)$	Serial I/O2 clock input cycle time	2000			ns
$t_{wH}(SCLK1)$	Serial I/O1 clock input "H" pulse width (Note)	950			ns
$t_{wH}(SCLK2)$	Serial I/O2 clock input "H" pulse width	950			ns
$t_{wL}(SCLK1)$	Serial I/O1 clock input "L" pulse width (Note)	950			ns
$t_{wL}(SCLK2)$	Serial I/O2 clock input "L" pulse width	950			ns
$t_{su}(RXD-SCLK1)$	Serial I/O1 input set up time	400			ns
$t_{su}(SIN2-SCLK2)$	Serial I/O2 input set up time	400			ns
$t_h(SCLK1-RXD)$	Serial I/O1 input hold time	200			ns
$t_h(SCLK2-SIN2)$	Serial I/O2 input hold time	300			ns

Note: When $f(X_{IN}) = 2$ MHz and bit 6 of address 001A16 is "1". Divide this value by four when $f(X_{IN}) = 2$ MHz and bit 6 of address 001A16 is "0".

APPENDIX

3.1 Electrical characteristics

Table 3.1.8 SWITCHING CHARACTERISTICS (1) ($V_{CC} = 4.0$ to 5.5 V, $V_{SS} = 0$ V, $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
$t_{wH}(S_{CLK1})$	Serial I/O1 clock output "H" pulse width	Fig. 3.1.1	$t_c(S_{CLK1})/2-30$			ns
$t_{wH}(S_{CLK2})$	Serial I/O2 clock output "H" pulse width		$t_c(S_{CLK2})/2-160$			ns
$t_{wL}(S_{CLK1})$	Serial I/O1 clock output "L" pulse width		$t_c(S_{CLK1})/2-30$			ns
$t_{wL}(S_{CLK2})$	Serial I/O2 clock output "L" pulse width		$t_c(S_{CLK2})/2-160$			ns
$t_d(S_{CLK1}-TxD)$	Serial I/O1 output delay time (Note 1)				140	ns
$t_d(S_{CLK2}-SOUT2)$	Serial I/O2 output delay time (Note 2)				200	ns
$t_v(S_{CLK1}-TxD)$	Serial I/O1 output valid time (Note 1)		-30			ns
$t_v(S_{CLK2}-SOUT2)$	Serial I/O2 output valid time (Note 2)		0			ns
$t_r(S_{CLK1})$	Serial I/O1 clock output rising time				30	ns
$t_f(S_{CLK1})$	Serial I/O1 clock output falling time				30	ns
$t_r(S_{CLK2})$	Serial I/O2 clock output rising time				30	ns
$t_f(S_{CLK2})$	Serial I/O2 clock output falling time				40	ns
$t_r(CMOS)$	CMOS output rising time (Note 3)			10	30	ns
$t_f(CMOS)$	CMOS output falling time (Note 3)			10	30	ns

Note1: When the P45/TxD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0".

2: When the P51/SOUT2 P-channel output disable bit of the serial I/O2 control register (bit 7 of address 001D16) is "0".

3: XOUT pin is excluded.

Table 3.1.9 SWITCHING CHARACTERISTICS (2) ($V_{CC} = 3.0$ to 5.5 V, $V_{SS} = 0$ V, $T_a = -20$ to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.

3.1 Electrical characteristics

3.1.7 Absolute maximum ratings (Extended operating temperature version)

Table 3.1.14 Absolute maximum ratings (Extended operating temperature version)

Symbol	Parameter	Conditions	Ratings	Unit
VCC	Power source voltage	All voltage are based on VSS. Output transistors are cut off.	-0.3 to 7.0	V
Vi	Input voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67, VREF		-0.3 to VCC +0.3	V
Vi	Input voltage $\overline{\text{RESET}}$, XIN		-0.3 to VCC +0.3	V
Vi	Input voltage CNVSS		-0.3 to 13	V
VO	Output voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67, XOUT		-0.3 to VCC +0.3	V
Pd	Power dissipation	Ta = 25 °C	1000 (Note)	mW
Topr	Operating temperature		-40 to 85	°C
Tstg	Storage temperature		-65 to 150	°C

Note: 300mW in case of the flat package

3.1.8 Recommended operating conditions (Extended operating temperature version)

Table 3.1.15 Recommended operating conditions (Extended operating temperature version)

(VCC = 4.0 to 5.5 V, Ta = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
VCC	Power source voltage (f(XIN) ≤ 2 MHz)	4.0	5.0	5.5	V
VSS	Power source voltage		0		V
VREF	Analog reference voltage (when A-D converter is used)	2.0		VCC	V
	Analog reference voltage (when D-A converter is used)	4.0		VCC	V
AVSS	Analog power source voltage		0		V
VIA	Analog input voltage AN0–AN7	AVSS		VCC	V
VIH	“H” input voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	0.8 VCC		VCC	V
VIH	“H” input voltage $\overline{\text{RESET}}$, XIN, CNVSS	0.8 VCC		VCC	V
VIL	“L” input voltage P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67	0		0.2 VCC	V
VIL	“L” input voltage $\overline{\text{RESET}}$, CNVSS	0		0.2 VCC	V
VIL	“L” input voltage XIN	0		0.16 VCC	V
ΣIOH(peak)	“H” total peak output current P00–P07, P10–P17, P20–P27, P30–P37 (Note 1)			-80	mA
ΣIOH(peak)	“H” total peak output current P40–P47, P50–P57, P60–P67 (Note 1)			-80	mA
ΣIOL(peak)	“L” total peak output current P00–P07, P10–P17, P20–P27, P30–P37 (Note 1)			80	mA
ΣIOL(peak)	“L” total peak output current P40–P47, P50–P57, P60–P67 (Note 1)			80	mA
ΣIOH(avg)	“H” total average output current P00–P07, P10–P17, P20–P27, P30–P37 (Note 1)			-40	mA
ΣIOH(avg)	“H” total average output current P40–P47, P50–P57, P60–P67 (Note 1)			-40	mA
ΣIOL(avg)	“L” total average output current P00–P07, P10–P17, P20–P27, P30–P37 (Note 1)			40	mA
ΣIOL(avg)	“L” total average output current P40–P47, P50–P57, P60–P67 (Note 1)			40	mA
IOH(peak)	“H” peak output current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 2)			-10	mA
IOL(peak)	“L” peak output current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 2)			10	mA
IOH(avg)	“H” average output current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 3)			-5	mA
IOL(avg)	“L” average output current P00–P07, P10–P17, P20–P27, P30–P37, P40–P47, P50–P57, P60–P67 (Note 3)			5	mA
f(XIN)	Internal clock oscillation frequency (VCC = 4.0 to 5.5 V)			8	MHz

Note 1: The total output current is the sum of all the currents flowing through all the applicable ports. The total average current is an average value measured over 100 ms. The total peak current is the peak value of all the currents.

2: The peak output current is the peak current flowing in each port.

3: The average output current IOL(avg), IOH(avg) in an average value measured over 100 ms.

APPENDIX

3.1 Electrical characteristics

3.1.9 Electrical characteristics (Extended operating temperature version)

Table 3.1.16 Electrical characteristics (Extended operating temperature version)

(V_{CC} = 4.0 to 5.5 V, V_{SS} = 0 V, T_a = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
V _{OH}	"H" output voltage P00-P07, P10-P17, P20-P27, P30-P37, P40-P47, P50-P57, P60-P67 (Note 1)	I _{OH} = -10 mA	V _{CC} -2.0			V
V _{OL}	"L" output voltage P00-P07, P10-P17, P20-P27, P30-P37, P40-P47, P50-P57, P60-P67	I _{OL} = 10 mA			2.0	V
V _{T+} - V _{T-}	Hysteresis CNTR0, CNTR1, INT0-INT4			0.4		V
V _{T+} - V _{T-}	Hysteresis RXD, SCLK1, SIN2, SCLK2			0.5		V
V _{T+} - V _{T-}	Hysteresis RESET			0.5		V
I _{IH}	"H" input current P00-P07, P10-P17, P20-P27, P30-P37, P40-P47, P50-P57, P60-P67	V _I = V _{CC}			5.0	μA
I _{IH}	"H" input current RESET, CNV _{SS}	V _I = V _{CC}			5.0	μA
I _{IH}	"H" input current X _{IN}	V _I = V _{CC}		4		μA
I _{IL}	"L" input current P00-P07, P10-P17, P20-P27, P30-P37, P40-P47, P50-P57, P60-P67, RESET, CNV _{SS}	V _I = V _{SS}			-5.0	μA
I _{IL}	"L" input current X _{IN}	V _I = V _{SS}		-4		μA
V _{RAM}	RAM hold voltage	When clock stopped	2.0		5.5	V
I _{CC}	Power source current	f(X _{IN}) = 8 MHz		6.4	13	mA
		f(X _{IN}) = 5 MHz		4	8	
		When WIT instruction is executed with f(X _{IN}) = 8 MHz		1.5		
		When WIT instruction is executed with f(X _{IN}) = 5 MHz		1		
		When STP instruction is executed with clock stopped, output transistors isolated.	T _a = 25 °C (Note 2) T _a = 85 °C (Note 2)		0.1	1

Note 1: P45 is measured when the P45/TXD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0".

P51 is measured when the P51/SOUT2 P-channel output disable bit of the serial I/O2 control register (bit 7 of address 001D16) is "0".

2: With output transistors isolated and A-D converter having completed conversion, and not including current flowing through V_{REF} pin.

3.1.10 A-D converter characteristics (Extended operating temperature version)

Table 3.1.17 A-D CONVERTER CHARACTERISTICS (Extended operating temperature version)

(V_{CC} = 4.0 to 5.5 V, V_{SS} = AV_{SS} = 0 V, V_{REF} = 2.0 V to V_{CC}, T_a = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
—	Resolution				8	Bits
—	Absolute accuracy (excluding quantization error)			±1	±2.5	LSB
t _{CONV}	Conversion time				50	t _{C(φ)}
RLADDER	Ladder resistor			35		kΩ
I _{VREF}	Reference power source input current (Note)	V _{REF} = 5.0 V	50	150	200	μA
I _{I(AD)}	A-D port input current			0.5	5.0	μA

Note: When D-A conversion registers (addresses 003616 and 003716) contain "0016".

3.1 Electrical characteristics

3.1.11 D-A converter characteristics (Extended operating temperature version)

Table 3.1.18 D-A CONVERTER CHARACTERISTICS (Extended operating temperature version)

(VCC = 4.0 to 5.5 V, VSS = AVSS = 0 V, VREF = 4.0 V to VCC, Ta = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
—	Resolution				8	Bits
—	Absolute accuracy				1.0	%
t _{su}	Setting time				3	μs
RO	Output resistor		1	2.5	4	kΩ
IVREF	Reference power source input current (Note)				3.2	mA

Note: Using one D-A converter, with the value in the D-A conversion register of the other D-A converter being "0016", and excluding currents flowing through the A-D resistance ladder.

APPENDIX

3.1 Electrical characteristics

3.1.12 Timing requirements and Switching characteristics (Extended operating temperature version)

Table 3.1.19 Timing requirements (Extended operating temperature version)

(VCC = 4.0 to 5.5 V, VSS = 0 V, Ta = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
t _w (RESET)	Reset input "L" pulse width	2			μs
t _c (XIN)	External clock input cycle time	125			ns
t _{wH} (XIN)	External clock input "H" pulse width	50			ns
t _{wL} (XIN)	External clock input "L" pulse width	50			ns
t _c (CNTR)	CNTR0, CNTR1 input cycle time	200			ns
t _{wH} (CNTR)	CNTR0, CNTR1 input "H" pulse width	80			ns
t _{wH} (INT)	INT0 to INT4 input "H" pulse width	80			ns
t _{wL} (CNTR)	CNTR0, CNTR1 input "L" pulse width	80			ns
t _{wL} (INT)	INT0 to INT4 input "L" pulse width	80			ns
t _c (SCLK1)	Serial I/O1 clock input cycle time (Note)	800			ns
t _c (SCLK2)	Serial I/O2 clock input cycle time	1000			ns
t _{wH} (SCLK1)	Serial I/O1 clock input "H" pulse width (Note)	370			ns
t _{wH} (SCLK2)	Serial I/O2 clock input "H" pulse width	400			ns
t _{wL} (SCLK1)	Serial I/O1 clock input "L" pulse width (Note)	370			ns
t _{wL} (SCLK2)	Serial I/O2 clock input "L" pulse width	400			ns
t _{su} (RxD-SCLK1)	Serial I/O1 input set up time	220			ns
t _{su} (SIN2-SCLK2)	Serial I/O2 input set up time	200			ns
t _h (SCLK1-RxD)	Serial I/O1 input hold time	100			ns
t _h (SCLK2-SIN2)	Serial I/O2 input hold time	200			ns

Note: When f(XIN) = 8 MHz and bit 6 of address 001A16 is "1". Divide this value by four when f(XIN) = 8 MHz and bit 6 of address 001A16 is "0".

Table 3.1.20 Switching characteristics (Extended operating temperature version)

(VCC = 4.0 to 5.5 V, VSS = 0 V, Ta = -40 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
t _{wH} (SCLK1)	Serial I/O1 clock output "H" pulse width	Fig. 3.1.1	t _c (SCLK1)/2-30			ns
t _{wH} (SCLK2)	Serial I/O2 clock output "H" pulse width		t _c (SCLK2)/2-160			ns
t _{wL} (SCLK1)	Serial I/O1 clock output "L" pulse width		t _c (SCLK1)/2-30			ns

APPENDIX

3.2 Standard characteristics

3.2.3 A-D conversion standard characteristics

Figure 3.2.7 shows the A-D conversion standard characteristics.

The lower-side line on the graph indicates the absolute precision error. It represents the deviation from the ideal value. For example, the conversion of output code from 127 to 128 occurs ideally at the point of ANo = 2550 mV, but the measured value is -5 mV. Accordingly, the measured point of conversion is represented as "2550 - 5 = 2545 mV."

The upper-side line on the graph indicates the width of input voltages equivalent to output codes. For example, the measured width of the input voltage for output code 170 is 23 mV, so the differential nonlinear error is represented as "23 - 20 = 3 mV" (0.15 LSB).

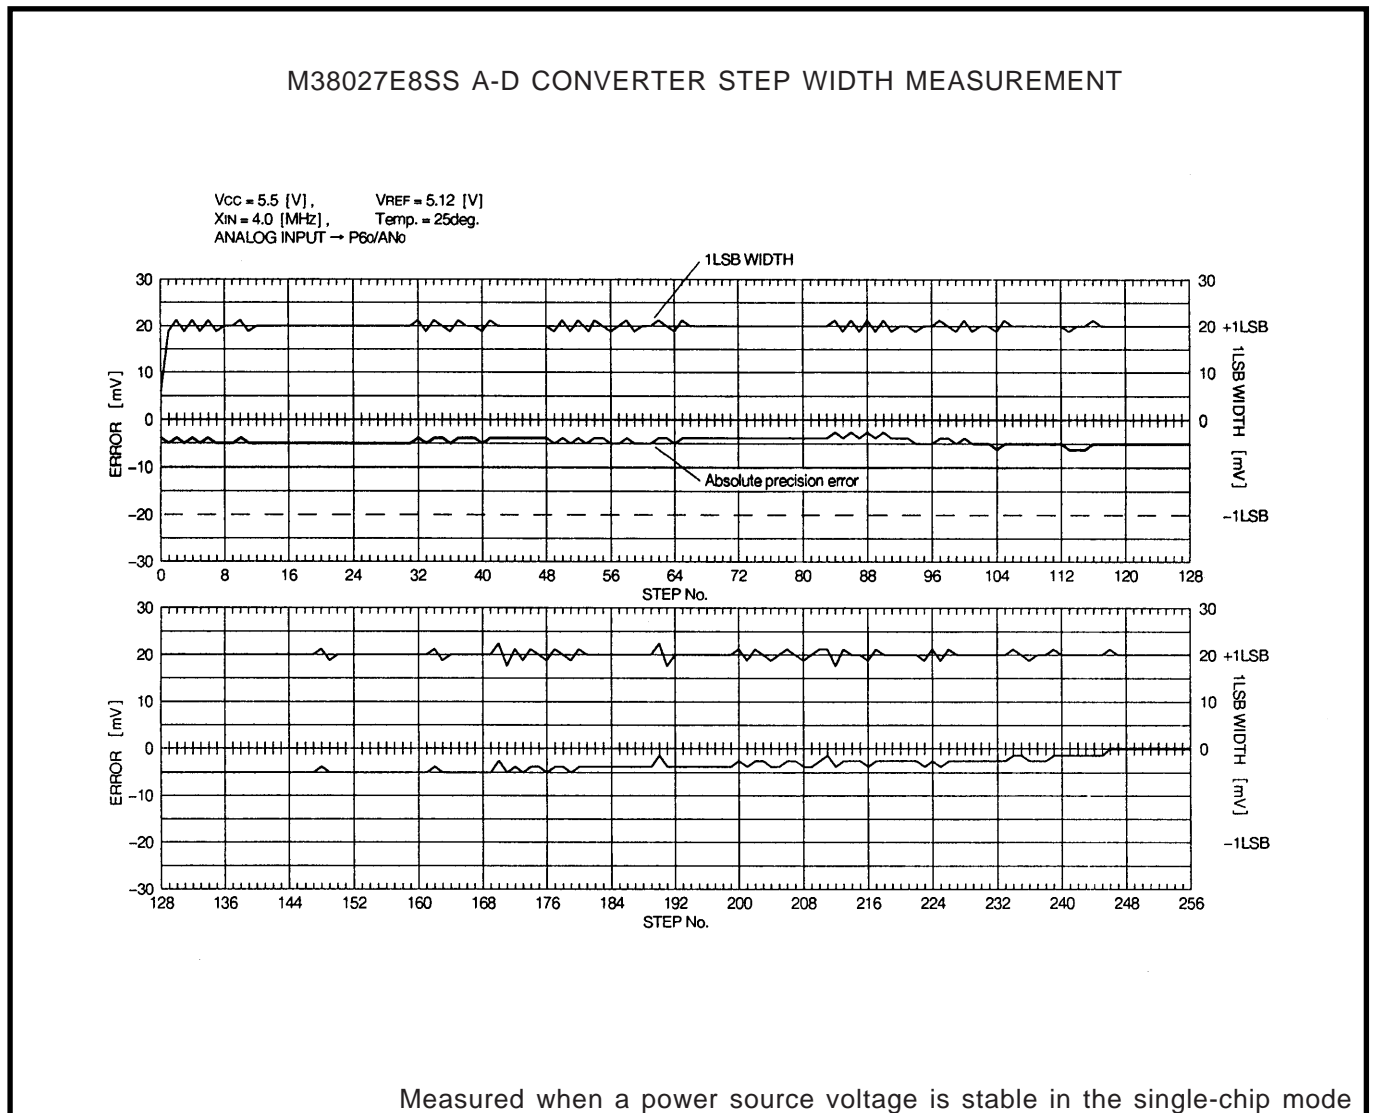

Fig. 3.2.7 A-D conversion standard characteristics

3.2.4 D-A conversion standard characteristics

Figure 3.2.8 shows the D-A conversion standard characteristics. The lower-side line on the graph indicates the absolute precision error. In this case, it represents the difference between the ideal analog output value for an input code and the measured value.

The upper-side line on the graph indicates the change width of output analog value to a one-bit change of input code.

Fig. 3.2.8 D-A conversion standard characteristics

APPENDIX

3.3 Notes on use

3.3 Notes on use

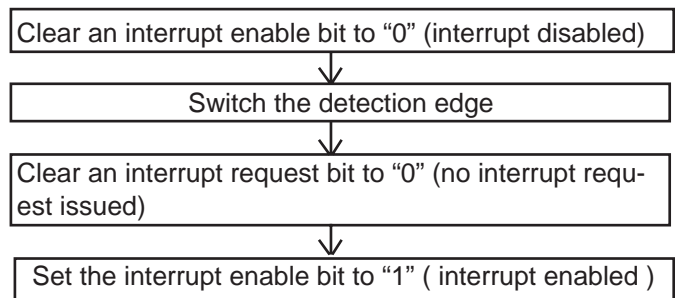

3.3.1 Notes on interrupts

(1) Sequence for switching an external interrupt detection edge

When the external interrupt detection edge must be switched, make sure the following sequence.

Reason

The interrupt circuit recognizes the switching of the detection edge as the change of external input signals. This may cause an unnecessary interrupt.

(2) Bit 7 of the interrupt control register 2

Fix the bit 7 of the interrupt control register 2 (Address:003F₁₆) to "0".

Figure 3.3.1 shows the structure of the interrupt control register 2.

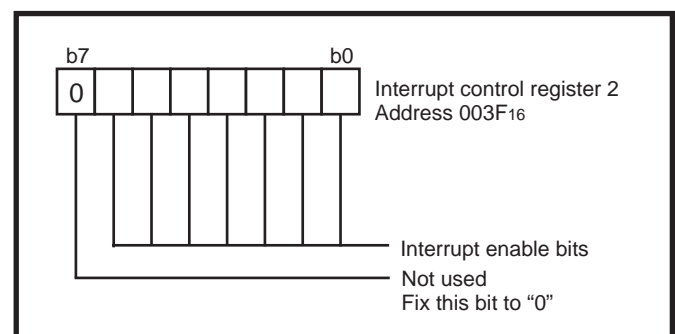

Fig. 3.3.1 Structure of interrupt control register 2

3.3.2 Notes on the serial I/O1

(1) Stop of data transmission

As for the serial I/O1 that can be used as either a clock synchronous or an asynchronous (UART) serial I/O, clear the transmit enable bit to "0" (transmit disabled), and clear the serial I/O enable bit to "0" (serial I/O1 disabled) in the following cases :

- when stopping data transmission during transmitting data in the clock synchronous serial I/O mode
- when stopping data transmission during transmitting data in the UART mode
- when stopping only data transmission during transmitting and receiving data in the UART mode

Reason

Since transmission is not stopped and the transmission circuit is not initialized even if the serial I/O1 enable bit is cleared to "0" (serial I/O1 disabled), the internal transmission is running (in this case, since pins TxD, RxD, SCLK1, and SRDY1 function as I/O ports, the transmission data is not output). When data is written to the transmit buffer register in this state, the data is transferred to the transmit shift register and start to be shifted. When the serial I/O1 enable bit is set to "1" at this time, the data during internally shifting is output to the TxD pin and it may cause an operation failure to a microcomputer.

(2) Stop of data reception

As for the serial I/O1 that can be used as either a clock synchronous or an asynchronous (UART) serial I/O, clear the receive enable bit to "0" (receive disabled), or clear the serial I/O enable bit to "0" (serial I/O disabled) in the following case :

- when stopping data reception during receiving data in the clock synchronous serial I/O mode

Clear the receive enable bit to "0" (receive disabled) in the following cases :

- when stopping data reception during receiving data in the UART mode
- when stopping only data reception during transmitting and receiving data in the UART mode

(3) Stop of data transmission and reception in a clock synchronous serial I/O mode

As for the serial I/O1 that can be used as either a clock synchronous or an asynchronous (UART) serial I/O, clear both the transmit enable bit and receive enable bit to "0" (transmit and receive disabled) at the same time in the following case:

- when stopping data transmission and reception during transmitting and receiving data in the clock synchronous mode (when data is transmitted and received in the clock synchronous serial I/O mode, any one of data transmission and reception cannot be stopped.)

Reason

In the clock synchronous serial I/O mode, the same clock is used for transmission and reception. If any one of transmission and reception is disabled, a bit error occurs because transmission and reception cannot be synchronized.

In this mode, the clock circuit of the transmission circuit also operates for data reception. Accordingly, the transmission circuit does not stop by clearing only the transmit enable bit to "0" (transmit disabled). Also, the transmission circuit is not initialized by clearing the serial I/O1 enable bit to "0" (serial I/O1 disabled) (refer to (1)).

(4) The $\overline{\text{SRDY}}$ pin on a receiving side

When signals are output from the $\overline{\text{SRDY}}$ pin on the reception side by using an external clock in the clock synchronous serial I/O mode, set all of the receive enable bit, the $\overline{\text{SRDY}}$ output enable bit, and the transmit enable bit to "1" (transmit enabled).

(5) Stop of data reception in a clock synchronous serial I/O mode

Set the serial I/O1 control register again after the transmission and the reception circuits are reset by clearing both the transmit enable bit and the receive enable bit to "0."

(6) Control of data transmission using the transmit shift completion flag

The transmit shift completion flag changes from "1" to "0" with a delay of 0.5 to 1.5 shift clocks. When checking the transmit shift completion flag after writing a data to the transmit buffer register for controlling a data transmission, note this delay.

(7) Control of data transmission using an external clock

When an external clock is used as the synchronous clock for data transmission, set the transmit enable bit to "1" at "H" level of the SCLK input signal. Also, write data to the transmit buffer register at "H" level of the SCLK input signal.

3.3.3 Notes on the A-D converter

(1) Input of signals from signal source with high impedance to an analog input pin

Make the signal source impedance for analog input low, or equip an analog input pin with an external capacitor of 0.01 μF to 1 μF . Further, make sure to check the operation of application products on the user side.

Reason

The A-D converter builds in the capacitor for analog voltage comparison. Accordingly, when signals from signal source with high impedance are input to an analog input pin, a charge and discharge noise generates. This may cause the A-D conversion precision to be worse.

APPENDIX

3.3 Notes on use

(2) AVss pin

Connect a power source for the A-D converter, AVss pin to the Vss line of the analog circuit.

(3) A clock frequency during an A-D conversion

The comparator consists of a capacity coupling, and a charge of the capacity will be lost if the clock frequency is too low. Thus, make sure the following during an A-D conversion.

- $f(X_{IN})$ is 500 kHz or more .
(When the \overline{ONW} pin is "L", $f(X_{IN})$ is 1 MHz or more.)
- Do not execute the STP instruction and WIT instruction.

3.3.4 Notes on the \overline{RESET} pin

When a rising time of the reset signal is long, connect a ceramic capacitor or others across the \overline{RESET} pin and the Vss pin. And use a 1000 pF or more capacitor for high frequency use. When connecting the capacitor, make sure the following :

- Make the length of the wiring which is connected to a capacitor the shortest possible.
- Make sure to check the operation of application products on the user side.

Reason

If the several nanosecond or several ten nanosecond impulse noise enters the \overline{RESET} pin, a microcomputer may malfunction.

3.3.5 Notes on input and output pins

(1) Fix of a port input level in stand-by state

Fix input levels of an input and an I/O port for getting effect of low-power dissipation in stand-by state, especially for the I/O ports of the N-channel open-drain.

Pull-up (connect the port to VCC) or pull-down (connect the port to Vss) these ports through a resistor.

When determining a resistance value, make sure the following:

- External circuit
- Variation of output levels during the ordinary operation

* stand-by state : the stop mode by executing the **STP** instruction
the wait mode by executing the **WIT** instruction

Reason

Even when setting as an output port with its direction register, in the following state :

● N-channel.....when the content of the port latch is "1"
the transistor becomes the OFF state, which causes the ports to be the high-impedance state. Make sure that the level becomes "undefined" depending on external circuits.

Accordingly, the potential which is input to the input buffer in a microcomputer is unstable in the state that input levels of an input and an I/O port are "undefined." This may cause power source current.

(2) Modify of the content of I/O port latch

When the content of the port latch of an I/O port is modified with the bit managing instruction*, the value of the unspecified bit may be changed.

Reason

The bit managing instruction is read-modify-write instruction for reading and writing data by a byte unit. Accordingly, when this instruction is executed on one bit of the port latch of an I/O port, the following is executed to all bits of the port latch.

- As for a bit which is set as an input port : The pin state is read in the CPU, and is written to this bit after bit managing.
- As for a bit which is set as an output port : The bit value is read in the CPU, and is written to this bit after bit managing.

Make sure the following :

- Even when a port which is set as an output port is changed for an input port, its port latch holds the output data.
- Even when a bit of a port latch which is set as an input port is not specified with a bit managing instruction, its value may be changed in case where content of the pin differs from a content of the port latch.

* bit managing instructions : **SEB** and **CLB** instruction

(3) The AVss pin when not using the A-D converter

When not using the A-D converter, handle a power source pin for the A-D converter, AVss pin as follows :

- AVss : Connect to the Vss pin

Reason

If the AVss pin is opened, the microcomputer may malfunction by effect of noise or others.

3.3.6 Notes on memory expansion mode and microprocessor mode

(1) Writing data to the port latch of port P3

In the memory expansion or the microprocessor mode, ports P30 and P31 can be used as the output port. Use the **LDM** or **STA** instruction for writing data to the port latch (address 0006₁₆) of port P3.

When using a read-modify-write instruction (the **SEB** or the **CLB** instruction), allocate the read and the write enabled memory at address 0006₁₆.

Reason

In the memory expansion or microprocessor mode, address 0006₁₆ is allocated in the external area.

Accordingly,

- Data is read from the external memory.
- Data is written to both the port latch of the port P3 and the external memory.

Accordingly, when executing a read-modify-write instruction for address 0006₁₆, external memory data is read and modified, and the result is written in both the port latch of the port P3 and the external memory. If the read enabled memory is not allocated at address 0006₁₆, the read data is undefined. The undefined data is modified and written to the port latch of the port P3. The port latch data of port P3 becomes "undefined."

(2) Overlap of an internal memory and an external memory

When the internal and the external memory are overlapped in the memory expansion mode, the internal memory is valid in this overlapped area. When the CPU writes or reads to this area, the following is performed :

- When reading data
Only the data in the internal memory is read into the CPU and the data in the external memory is not read into the CPU. However, as the read signal and address are still valid, the external memory data of the corresponding address is output to the external data bus.
- When writing data
Data is written in both the internal and the external memory.

APPENDIX

3.3 Notes on use

3.3.7 Notes on built-in PROM

(1) Programming adapter

To write or read data into/from the internal PROM, use the dedicated programming adapter and general-purpose PROM programmer as shown in Table 3.3.1.

Table 3.3.1 Programming adapter

Microcomputer	Programming adapter
M38027E8SS	PCA4738S-64A
M38027E8SP (one-time blank)	
M38027E8DSP (one-time blank)	
M38027E8FS	
M38027E8FP (one-time blank)	PCA4738F-64A
M38027E8DFP (one-time blank)	

(2) Write and read

In PROM mode, operation is the same as that of the M5M27C256AK and the M5M27C101, but programming conditions of PROM programmer are not set automatically because there are no internal device ID codes. Accurately set the following conditions for data write/read. Take care not to apply 21 V to Vpp pin (is also used as the CNVSS pin), or the product may be permanently damaged.

- Programming voltage : 12.5 V
- Setting of programming adapter switch : refer to table 3.3.2
- Setting of PROM programmer address : refer to table 3.3.3

Table 3.3.2 Setting of programming adapter switch

Programming adapter	SW 1	SW 2	SW 3

M38022E4FP		
M38022E4DSP		
M38022E4DFP		
M38027E8SS	Address : 0080 ₁₆ (Note 2)	Address : 7FFD ₁₆ (Note 2)
M38027E8SP		
M38027E8FS		
M38027E8FP		
M38027E8DSP		
M38027E8DFP		

Note1 : Addresses C080₁₆ to FFFD₁₆ in the internal PROM correspond to addresses 4080₁₆ to 7FFD₁₆ in the ROM programmer.

2 : Addresses 8080₁₆ to FFFD₁₆ in the internal PROM correspond to addresses 0080₁₆ to 7FFD₁₆ in the ROM programmer.

(3) Erasing

Contents of the windowed EPROM are erased through an ultraviolet light source of the wavelength 2537-Ångstrom . At least 15 W-sec/cm² are required to erase EPROM contents.

APPENDIX

3.4 Countermeasures against noise

3.4 Countermeasures against noise

Countermeasures against noise are described below. The following countermeasures are effective against noise in theory, however, it is necessary not only to take measures as follows but to evaluate before actual use.

3.4.1 Shortest wiring length

The wiring on a printed circuit board can be as an antenna which feeds noise into the microcomputer.

The shorter the total wiring length (by mm unit), the less the possibility of noise insertion into a microcomputer.

(1) Wiring for the $\overline{\text{RESET}}$ pin

Make the length of wiring which is connected to the $\overline{\text{RESET}}$ pin as short as possible. Especially, connect a capacitor across the $\overline{\text{RESET}}$ pin and the V_{SS} pin with the shortest possible wiring (within 20mm).

Reason

The reset works to initialize a microcomputer.

The width of a pulse input into the $\overline{\text{RESET}}$ pin is determined by the timing necessary conditions. If noise having a shorter pulse width than the standard is input to the $\overline{\text{RESET}}$ pin, the reset is released before the internal state of the microcomputer is completely initialized. This may cause a program runaway.

Fig. 3.4.1 Wiring for the $\overline{\text{RESET}}$ pin

(2) Wiring for clock input/output pins

- Make the length of wiring which is connected to clock I/O pins as short as possible.
- Make the length of wiring (within 20mm) across the grounding lead of a capacitor which is connected to an oscillator and the V_{SS} pin of a microcomputer as short as possible.
- Separate the V_{SS} pattern only for oscillation from other V_{SS} patterns.

Reason

A microcomputer's operation synchronizes with a clock generated by the oscillator (circuit). If noise enters clock I/O pins, clock waveforms may be deformed. This may cause a malfunction or program runaway.

Also, if a potential difference is caused by the noise between the V_{SS} level of a microcomputer and the V_{SS} level of an oscillator, the correct clock will not be input in the microcomputer.

3.4 Countermeasures against noise

Fig. 3.4.2 Wiring for clock I/O pins

(3) Wiring for the VPP pin of the One Time PROM version and the EPROM version

(In this microcomputer the VPP pin is also used as the CNVss pin)

Connect an approximately 5 kΩ resistor to the VPP pin the shortest possible in series and also to the VSS pin. When not connecting the resistor, make the length of wiring between the VPP pin and the VSS pin the shortest possible.

Note: Even when a circuit which included an approximately 5 kΩ resistor is used in the Mask ROM version, the microcomputer operates correctly.

Reason

The VPP pin of the One Time PROM and the EPROM version is the power source input pin for the built-in PROM. When programming in the built-in PROM, the impedance of the VPP pin is low to allow the electric current for wiring flow into the PROM. Because of this, noise can enter easily. If noise enters the VPP pin, abnormal instruction codes or data are read from the built-in PROM, which may cause a program runaway.

Fig. 3.4.3 Wiring for the VPP pin of the One Time PROM and the EPROM version

3.4.2 Connection of a bypass capacitor across the Vss line and the Vcc line

Connect an approximately 0.1 μF bypass capacitor across the VSS line and the VCC line as follows:

- Connect a bypass capacitor across the VSS pin and the VCC pin at equal length.
- Connect a bypass capacitor across the VSS pin and the VCC pin with the shortest possible wiring.
- Use lines with a larger diameter than other signal lines for VSS line and VCC line.

Fig. 3.4.4 Bypass capacitor across the VSS line and the VCC line

APPENDIX

3.4 Countermeasures against noise

3.4.3 Wiring to analog input pins

- Connect an approximately 100 Ω to 1 kΩ resistor to an analog signal line which is connected to an analog input pin in series. Besides, connect the resistor to the microcomputer as close as possible.
- Connect an approximately 1000 pF capacitor across the VSS pin and the analog input pin. Besides, connect the capacitor to the VSS pin as close as possible. Also, connect the capacitor across the analog input pin and the VSS pin at equal length.

Reason

Signals which is input in an analog input pin (such as an A-D converter input pin) are usually output signals from sensor. The sensor which detects a change of event is installed far from the printed circuit board with a microcomputer, the wiring to an analog input pin is longer necessarily. This long wiring functions as an antenna which feeds noise into the microcomputer, which causes noise to an analog input pin.

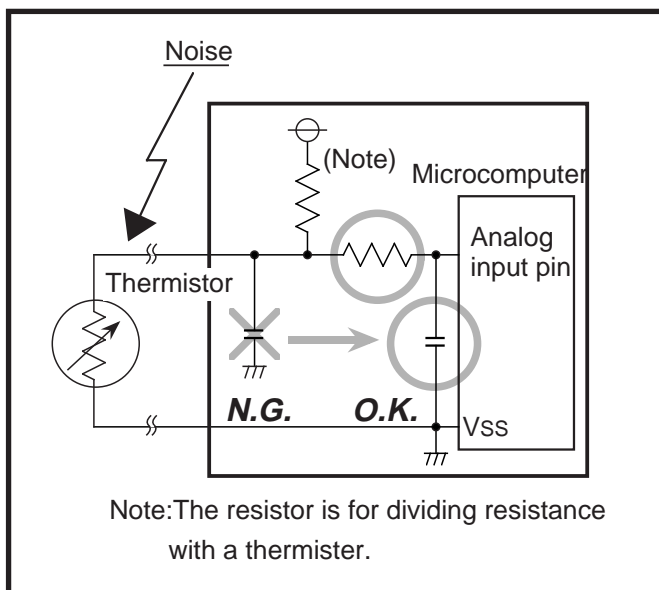

Fig.3.4.5 Analog signal line and a resistor and a capacitor

3.4.4. Consideration for oscillator

Take care to prevent an oscillator that generates clocks for a microcomputer operation from being affected by other signals.

(1) Keeping an oscillator away from large current signal lines

Install a microcomputer (and especially an oscillator) as far as possible from signal lines where a current larger than the tolerance of current value flows.

Reason

In the system using a microcomputer, there are signal lines for controlling motors, LEDs, and thermal heads or others. When a large current flows through those signal lines, strong noise occurs because of mutual inductance.

Fig.3.4.6 Wiring for a large current signal line

(2) Keeping an oscillator away from signal lines where potential levels change frequently

Install an oscillator and a connecting pattern of an oscillator away from signal lines where potential levels change frequently. Also, do not cross such signal lines over the clock lines or the signal lines which are sensitive to noise.

Reason

Signal lines where potential levels change frequently (such as the CNTR pin line) may affect other lines at signal rising or falling edge. If such lines cross over a clock line, clock waveforms may be deformed, which causes a microcomputer failure or a program runaway.

Fig.3.4.7 Wiring to a signal line where potential levels change frequently

3.4 Countermeasures against noise

3.4.5 Setup for I/O ports

Setup I/O ports using hardware and software as follows:

<Hardware>

- Connect a resistor of 100 Ω or more to an I/O port in series.

<Software>

- As for an input port, read data several times by a program for checking whether input levels are equal or not.
- As for an output port, since the output data may reverse because of noise, rewrite data to its port latch at fixed periods.
- Rewrite data to direction registers and pull-up control registers (only the product having it) at fixed periods.

Fig. 3.4.8 Setup for I/O ports

When a direction register is set for input port again at fixed periods, a several-nanosecond short pulse may be output from this port. If this is undesirable, connect a capacitor to this port to remove the noise pulse.

3.4.6 Providing of watchdog timer function by software

If a microcomputer runs away because of noise or others, it can be detected by a software watchdog timer and the microcomputer can be reset to normal operation. This is equal to or more effective than program runaway detection by a hardware watchdog timer. The following shows an example of a watchdog timer provided by software.

In the following example, to reset a microcomputer to normal operation, the main routine detects errors of the interrupt processing routine and the interrupt processing routine detects errors of the main routine. This example assumes that interrupt processing is repeated multiple times in a single main routine processing.

<The main routine>

- Assigns a single byte of RAM to a software watchdog timer (SWDT) and writes the initial value N in the SWDT once at each execution of the main routine. The initial value N should satisfy the following condition:

$$N+1 \geq (\text{Counts of interrupt processing executed in each main routine})$$

As the main routine execution cycle may change because of an interrupt processing or others, the initial value N should have a margin.

- Watches the operation of the interrupt processing routine by comparing the SWDT contents with counts of interrupt processing count after the initial value N has been set.
- Detects that the interrupt processing routine has failed and determines to branch to the program initialization routine for recovery processing in the following cases:
If the SWDT contents do not change after interrupt processing

Fig. 3.4.9 Watchdog timer by software

APPENDIX

3.4 Countermeasures against noise

<The interrupt processing routine>

- Decrements the SWDT contents by 1 at each interrupt processing.
- Determines that the main routine operates normally when the SWDT contents are reset to the initial value N at almost fixed cycles (at the fixed interrupt processing count).
- Detects that the main routine has failed and determines to branch to the program initialization routine for recovery processing in the following case:
When the contents of the SWDT reach 0 or less by continuative decrement without initializing to the initial value N .

APPENDIX

3.6 Mask ROM ordering method

GZZ-SH07-17B < 33A0 >

Mask ROM number	
-----------------	--

**740 FAMILY MASK ROM CONFIRMATION FORM
SINGLE-CHIP MICROCOMPUTER M38027M8-XXXSP/FP
MITSUBISHI ELECTRIC**

We recommend the use of the following pseudo-command to set the start address of the assembler source program.

EPROM type	27512
The pseudo-command	*=Δ\$0000 .BYTEΔ 'M38027M8-'

Note : If the name of the product written to the EPROMs does not match the name of the mask confirmation form, the ROM will not be processed.

* 2. Mark specification

Mark specification must be submitted using the correct form for the package being ordered. Fill out the appropriate mark specification form (64P4B for M38027M8-XXXSP, 64P6N for M38027M8-XXXFP) and attach it to the mask ROM confirmation form.

* 3. Usage conditions

Please answer the following questions about usage for use in our product inspection :

(1) How will you use the X_{IN}-X_{OUT} oscillator?

- | | |
|---|---|
| <input type="checkbox"/> Ceramic resonator | <input type="checkbox"/> Quartz crystal |
| <input type="checkbox"/> External clock input | <input type="checkbox"/> Other () |

At what frequency? f(X_{IN}) = MHz

(2) In which operation mode will you use your microcomputer?

- | | |
|--|--|
| <input type="checkbox"/> Single-chip mode | <input type="checkbox"/> Memory expansion mode |
| <input type="checkbox"/> Microprocessor mode | |

* 4. Comments

740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M38027M8DXXXSP/FP MITSUBISHI ELECTRIC

Mask ROM number	
-----------------	--

Receipt	Date :	
	Section head signature	Supervisor signature

Note : Please fill in all items marked *.

* Customer	Company name	TEL ()	issuance signature	Submitted by	Supervisor
	Date issued	Date :			

* 1. Confirmation

Specify the name of the product being ordered and the type of EPROMs submitted.

Three EPROMs are required for each pattern.

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

Microcomputer name : M38027M8DXXXSP M38027M8DXXXFP

Checksum code for entire EPROM

--	--	--	--

 (hexadecimal notation)

EPROM type (indicate the type used)

In the address space of the microcomputer, the internal ROM area is from address 8080₁₆ to FFFD₁₆. The reset vector is stored in addresses FFFC₁₆ and FFFD₁₆.

- (1) Set the data in the unused area (the shaded area of the diagram) to "FF₁₆".
- (2) The ASCII codes of the product name "M38027M8D" must be entered in addresses 0000₁₆ to 0008₁₆. And set the data "FF₁₆" in addresses 0009₁₆ to 000F₁₆. The ASCII codes and addresses are listed to the right in hexadecimal notation.

Address		Address	
0000 ₁₆	'M' = 4 D ₁₆	0008 ₁₆	'D' = 4 4 ₁₆
0001 ₁₆	'3' = 3 3 ₁₆	0009 ₁₆	FF ₁₆
0002 ₁₆	'8' = 3 8 ₁₆	000A ₁₆	FF ₁₆
0003 ₁₆	'0' = 3 0 ₁₆	000B ₁₆	FF ₁₆
0004 ₁₆	'2' = 3 2 ₁₆	000C ₁₆	FF ₁₆
0005 ₁₆	'7' = 3 7 ₁₆	000D ₁₆	FF ₁₆
0006 ₁₆	'M' = 4 D ₁₆	000E ₁₆	FF ₁₆
0007 ₁₆	'8' = 3 8 ₁₆	000F ₁₆	FF ₁₆

*** 4. Comments**

(2/2)

3.7 Mark specification form

64P6N (64-PIN QFP) MARK SPECIFICATION FORM

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi Catalog Name

Customer's parts number

Note: The fonts and size of characters are standard Mitsubishi type.

Mitsubishi IC catalog name

Note3: Customer's parts number can be up to 10 characters:

Only 0~9, A~Z, +, -, /, (,), &, ©, . (period), and , (comma) are usable.

4: If the Mitsubishi logo is not required, check the box below.

Mitsubishi logo is not required

5: Arrangement of Mitsubishi IC catalog name and Mitsubishi lot number is dependent on number of Mitsubishi IC catalog name and that Mitsubishi logo is required or not.

Note1: The mark field should be written right aligned.

2: The fonts and size of characters are standard Mitsubishi type. (The character size became smaller than A (standard Mitsubishi mark) type)

C. Special Mark Required

Note1: If the special mark is to be printed, indicate the desired layout of the mark in the left figure. The layout will be duplicated as close as possible. Mitsubishi lot number (6-digit or 7-digit) and mask ROM number (3-digit) are always marked.

2: If the customer's trade mark logo must be used in the special mark, check the box below. Please submit a clean original of the logo.

For the new special character fonts a clean font original (ideally logo drawing) must be submitted.

Special logo required

The standard Mitsubishi font is used for all characters except for a logo.

APPENDIX

3.7 Mark specification form

64P4B (64-PIN SHRINK DIP) MARK SPECIFICATION FORM

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi Catalog Name

Note1 : The mark field should be written right aligned.

2 : The fonts and size of characters are standard Mitsubishi type.

3 : Customer's parts number can be up to 19 characters :

Only 0~9, A~Z, +, -, /, (,), &, ©, . (period), and , (comma) are usable.

4 : If the Mitsubishi logo  is not required, check the box on the right.

 Mitsubishi logo is not required

C. Special Mark Required

Note1 : If the special mark is to be printed, indicate the desired layout of the mark in the upper figure. The layout will be duplicated as close as possible. Mitsubishi lot number (6-digit or 7-digit) and mask ROM number (3-digit) are always marked.

2 : If the customer's trade mark logo must be used in the special mark, check the box below. Please submit a clean original of the logo.

For the new special character fonts a clean font original (ideally logo drawing) must be submitted.

Special logo required

The standard Mitsubishi font is used for all characters except for a logo.

APPENDIX

3.10 Machine instructions

Symbol	Function	Details	Addressing mode																		
			IMP			IMM			A			BIT, A			ZP			BIT, ZP			
			OP	n	#	OP	n	#	OP	n	#	OP	n	#	OP	n	#	OP	n	#	
BVC (Note 4)	$V = 0?$	Branches when the contents of overflow flag is "0".																			
BVS (Note 4)	$V = 1?$	Branches when the contents of overflow flag is "1".																			
CLB	$Ab \text{ or } Mb \leftarrow 0$	Clears the contents of the bit specified in the accumulator or memory to "0".										$1B$	2	1					$1F$	5	2
CLC	$C \leftarrow 0$	Clears the contents of the carry flag to "0".	18	2	1																
CLD	$D \leftarrow 0$	Clears the contents of decimal mode flag to "0".	D8	2	1																
CLI	$I \leftarrow 0$	Clears the contents of interrupt disable flag to "0".	58	2	1																
CLT	$T \leftarrow 0$	Clears the contents of index X mode flag to "0".	12	2	1																
CLV	$V \leftarrow 0$	Clears the contents of overflow flag to "0".	B8	2	1																
CMP (Note 3)	When $T = 0$ $A - M$ When $T = 1$ $M(X) - M$	Compares the contents of accumulator and memory. Compares the contents of the memory specified by the addressing mode with the contents of the address indicated by index register X.							C9	2	2								C5	3	2
COM	$M \leftarrow \overline{M}$	Forms a one's complement of the contents of memory, and stores it into memory.																	44	5	2
CPX	$X - M$	Compares the contents of index register X and memory.							E0	2	2								E4	3	2
CPY	$Y - M$	Compares the contents of index register Y and memory.							C0	2	2								C4	3	2
DEC	$A \leftarrow A - 1$ or $M \leftarrow M - 1$	Decrements the contents of the accumulator or memory by 1.										1A	2	1					C6	5	2
DEX	$X \leftarrow X - 1$	Decrements the contents of index register X by 1.	CA	2	1																
DEY	$Y \leftarrow Y - 1$	Decrements the contents of index register Y by 1.	88	2	1																
DIV	$A \leftarrow (M(zz + X + 1),$ $M(zz + X)) / A$ $M(S) \leftarrow 1$'s complement of Remainder $S \leftarrow S - 1$	Divides the 16-bit data that is the contents of M (zz + x + 1) for high byte and the contents of M (zz + x) for low byte by the accumulator. Stores the quotient in the accumulator and the 1's complement of the remainder on the stack.																			
EOR (Note 1)	When $T = 0$ $A \leftarrow A \vee M$ When $T = 1$ $M(X) \leftarrow M(X) \vee M$	"Exclusive-ORs" the contents of accumulator and memory. The results are stored in the accumulator. "Exclusive-ORs" the contents of the memory specified by the addressing mode and the contents of the memory at the address indicated by index register X. The results are stored into the memory at the address indicated by index register X.							49	2	2								45	3	2
FST		Connects oscillator output to the XOUT pin.	E2	2	1																
INC	$A \leftarrow A + 1$ or $M \leftarrow M + 1$	Increments the contents of accumulator or memory by 1.										3A	2	1					E6	5	2
INX	$X \leftarrow X + 1$	Increments the contents of index register X by 1.	E8	2	1																
INY	$Y \leftarrow Y + 1$	Increments the contents of index register Y by 1.	C8	2	1																

APPENDIX

Symbol	Function	Details	Addressing mode																			
			IMP			IMM			A			BIT, A			ZP			BIT, ZP				
			OP	n	#	OP	n	#	OP	n	#	OP	n	#	OP	n	#	OP	n	#		
PHA	$M(S) \leftarrow A$ $S \leftarrow S - 1$	Saves the contents of the accumulator in memory at the address indicated by the stack pointer and decrements the contents of stack pointer by 1.	48	3	1																	
PHP	$M(S) \leftarrow PS$ $S \leftarrow S - 1$	Saves the contents of the processor status register in memory at the address indicated by the stack pointer and decrements the contents of the stack pointer by 1.	08	3	1																	
PLA	$S \leftarrow S + 1$ $A \leftarrow M(S)$	Increments the contents of the stack pointer by 1 and restores the accumulator from the memory at the address indicated by the stack pointer.	68	4	1																	
PLP	$S \leftarrow S + 1$ $PS \leftarrow M(S)$	Increments the contents of stack pointer by 1 and restores the processor status register from the memory at the address indicated by the stack pointer.	28	4	1																	
ROL		Shifts the contents of the memory or accumulator to the left by one bit. The high order bit is shifted into the carry flag and the carry flag is shifted into the low order bit.							2A	2	1					26	5	2				
ROR		Shifts the contents of the memory or accumulator to the right by one bit. The low order bit is shifted into the carry flag and the carry flag is shifted into the high order bit.							6A	2	1					66	5	2				
RRF		Rotates the contents of memory to the right by 4 bits.														82	8	2				
RTI	$S \leftarrow S + 1$ $PS \leftarrow M(S)$ $S \leftarrow S + 1$ $PCL \leftarrow M(S)$ $S \leftarrow S + 1$ $PCH \leftarrow M(S)$	Returns from an interrupt routine to the main routine.	40	6	1																	
RTS	$S \leftarrow S + 1$ $PCL \leftarrow M(S)$ $S \leftarrow S + 1$ $PCH \leftarrow M(S)$	Returns from a subroutine to the main routine.	60	6	1																	
SBC (Note 1) (Note 5)	When $T = 0$ $A \leftarrow A - M - \overline{C}$ When $T = 1$ $M(X) \leftarrow M(X) - M - \overline{C}$	Subtracts the contents of memory and complement of carry flag from the contents of accumulator. The results are stored into the accumulator. Subtracts contents of complement of carry flag and contents of the memory indicated by the addressing mode from the memory at the address indicated by index register X. The results are stored into the memory of the address indicated by index register X.							E9	2	2					E5	3	2				
SEB	$Ab \text{ or } Mb \leftarrow 1$	Sets the specified bit in the accumulator or memory to "1".														$0B_{7i}$	2	1		$0F_{7i}$	5	2
SEC	$C \leftarrow 1$	Sets the contents of the carry flag to "1".	38	2	1																	
SED	$D \leftarrow 1$	Sets the contents of the decimal mode flag to "1".	F8	2	1																	
SEI	$I \leftarrow 1$	Sets the contents of the interrupt disable flag to "1".	78	2	1																	
SET	$T \leftarrow 1$	Sets the contents of the index X mode flag to "1".	32	2	1																	
SLW		Disconnects the oscillator output from the XOUT pin.	C2	2	1

0019 ₁₆	Serial I/O1 status register (SIO1STS)	0039 ₁₆	
001A ₁₆	Serial I/O1 control register (SIO1CON)	003A ₁₆	Interrupt edge selection register (INTEDGE)
001B ₁₆	UART control register (UARTCON)	003B ₁₆	CPU mode register (CPUM)
001C ₁₆	Baud rate generator (BRG)	003C ₁₆	Interrupt request register 1 (IREQ1)
001D ₁₆	Serial I/O2 control register (SIO2CON)	003D ₁₆	Interrupt request register 2 (IREQ2)
001E ₁₆		003E ₁₆	Interrupt control register 1 (ICON1)
001F ₁₆	Serial I/O2 register (SIO2)	003F ₁₆	Interrupt control register 2 (ICON2)

3.12 Pin configuration

PIN CONFIGURATION (TOP VIEW)

Package type : 64P6N-A
64-pin plastic-molded QFP

APPENDIX

3.12 Pin configuration

PIN CONFIGURATION (TOP VIEW)

**Package type : 64P4B
64-pin shrink plastic-molded DIP**

**MITSUBISHI SEMICONDUCTORS
USER'S MANUAL
