

6-A, WIDE-INPUT ADJUSTABLE SWITCHING REGULATOR

FEATURES

- 6-A Output Current
- Wide-Input Voltage (7 V to 36 V) / (15 V to 36 V)
- Wide-Output Voltage Adjust (2.5 V to 12.6 V) / (11.85 V to 22 V)
- High Efficiency (Up to 96%)
- On/Off Inhibit
- Undervoltage Lockout
- Output Current Limit

- Overtemperature Shutdown
- Operating Temperature: -40°C to 85°C
- Surface Mount Package Available

APPLICATIONS

- General-Purpose, Industrial Controls, HVAC Systems, Test and Measurement, Medical Instrumentation, AC/DC Adaptors, Vehicles, Marine, and Avionics

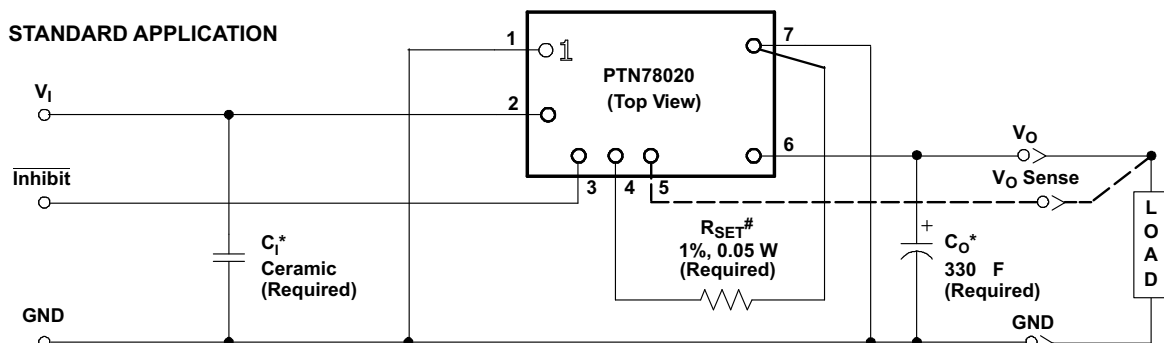

DESCRIPTION

The PTN78020 is a series of high-efficiency, step-down integrated switching regulators (ISRs), that represent the third generation in the evolution of high-performance power modules designed for industrial use. The wide-input voltage range makes these modules suitable for a variety of applications that operate off 12-V, 24-V, and 28-V dc power. In new designs they should be considered in place of the PT6620, PT6650, PT6680, and PT6880 series of single in-line pin (SIP) products. The PTN78020 is smaller and lighter than its predecessors, and has either similar or improved electrical performance characteristics. The caseless, double-sided package has excellent thermal characteristics, and is compatible with TI's roadmap for RoHS and lead-free compliance.

Operating from a wide-input voltage range, the PTN78020 provides high-efficiency, step-down voltage conversion for loads of up to 6 A. The output voltage is set using a single, external resistor. The PTN78020W may be set to any value within the range, 2.5 V to 12.6 V, and the PTN78020H from 11.85 V to 22 V. The output voltage of the PTN78020W can be as little as 2 V lower than the input, allowing operation down to 7 V, with an output voltage of 5 V. The output voltage of the PTN78020H can be as little as 3 V lower than the input, allowing operation down to 15 V, with an output voltage of 12 V.

The PTN78020 has undervoltage lockout, an integral on/off inhibit, and includes an output current limit and overtemperature protection.

*See the *Application Information* section for capacitor recommendations. The minimum input capacitance for is 2.2 F for PTN78020W, and 18.8 F (4 x 4.7 F) for PTN78020H

#R_{SET} is required to adjust the output voltage. See the *Application Information* section for values.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

PTN78020 (Basic Model)			
Output Voltage	Part Number	Description	Package Designator
2.5 V - 12.6 V	PTN78020WAH	Horizontal T/H	EUK-7
	PTN78020WAS ⁽¹⁾⁽²⁾	Horizontal SMD	EUL-7
	PTN78020WAZ ⁽²⁾⁽³⁾		
11.85 V - 22 V	PTN78020HAH	Horizontal T/H	EUK-7
	PTN78020HAS ⁽¹⁾⁽²⁾	Horizontal SMD	EUL-7
	PTN78020HAZ ⁽²⁾⁽³⁾		

- (1) *Standard option* specifies Sn/Pb solder ball material.
 (2) Add a T suffix for tape and reel option on SMD packages.
 (3) *Pb-free option* specifies Sn/Ag solder ball material.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

over operating free-air temperature range unless otherwise noted
 all voltages with respect to GND

			UNIT
T _A	Operating free-air temperature	Over V _I range	–40°C to 85°C
	Solder reflow temperature	Surface temperature of module body or pins	Horizontal SMD (suffix AS) 235°C
			Horizontal SMD (suffix AZ) 260°C
T _S	Storage temperature		–40°C to 125°C
V _I	Input surge voltage, 10 ms maximum		38 V
V _{INH}	Inhibit (pin 3) input voltage		–0.3 V to 5 V
P _O	Output power	V _I ≤ 24 V or V _O ≥ 15 V	90 W

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT
V _I	Input voltage	PTN78020W	7	36
		PTN78020H	15	36
T _A	Operating free-air temperature	–40	85	°C

PACKAGE SPECIFICATIONS

PTN78020x (Suffix AH, AS, & AZ)			
Weight			7.3 grams
Flammability	Meets UL 94 V-O		
Mechanical shock	Per Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted	Horizontal T/H (suffix AH)	250 Gs ⁽¹⁾
		Horizontal SMD (suffix AS and AZ)	125 Gs ⁽¹⁾
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz	Horizontal T/H (suffix AH)	20 Gs ⁽¹⁾
		Horizontal SMD (suffix AS and AZ)	10 Gs ⁽¹⁾

- (1) Qualification limit.

- (1) Above an input voltage of 24 V, the maximum output current must be derated by 125 mA per volt above 24 V.
- (2) For output voltages less than 10 V, the minimum input voltage is 7 V or $(V_O + 2)\text{ V}$, whichever is greater. For output voltages of 10 V and higher, the minimum input voltage is $(V_O + 2.5)\text{ V}$. See the Application Information section for further guidance.
- (3) For output voltages less than 3.6 V, the maximum input voltage is $10 \times V_O$. See the Application Information section for further guidance.
- (4) The set-point voltage tolerance is affected by the tolerance and stability of R_{SET} . The stated limit is unconditionally met if R_{SET} has a tolerance of 1% with with 100 ppm/ $^\circ\text{C}$ or better temperature stability.
- (5) This control pin has an internal pullup, and if left open-circuit, the module operates when input power is applied. The open-circuit voltage is typically 1.5 V. A small, low-leakage ($< 100\text{ nA}$) MOSFET is recommended for control. See the Application Information section for further guidance.
- (6) An external 2.2- μF ceramic capacitor is required across the input (V_I and GND) for proper operation. Locate the capacitor close to the module.
- (7) 330 μF of output capacitance is required for proper operation. See the Application Information section for further guidance.
- (8) This is the typical ESR for all the electrolytic (nonceramic) capacitance. Use 17 m Ω as the minimum when using max-ESR values to calculate.

- (1) The maximum output current is 6 A or a maximum output power of 90 W, whichever is less. Above an input voltage of 24 V, the maximum output current must be derated by 125 mA per volt above 24 V. See the Typical Characteristics section for further guidance.
- (2) Above an output voltage of 15 V, the maximum output current must be derated by 285 mA per volt. The maximum output power is 90 W. See the application information for further guidance.
- (3) For output voltages less than 19 V, the minimum input voltage is 15 V or $(V_O + 3)\text{ V}$, whichever is greater. For output voltages of 19 V and higher, the minimum input voltage is $(V_O + 4)\text{ V}$. See the Application Information section for further guidance.
- (4) The set-point voltage tolerance is affected by the tolerance and stability of R_{SET} . The stated limit is unconditionally met if R_{SET} has a tolerance of 1% with with 100 ppm/ $^\circ\text{C}$ or better temperature stability.
- (5) This control pin has an internal pullup, and if left open-circuit, the module operates when input power is applied. The open-circuit voltage is typically 1.5 V. A small, low-leakage ($< 100\text{ nA}$) MOSFET is recommended for control. See the Application Information section for further guidance.
- (6) Four external 4.7- μF ceramic capacitors are required across the input (V_I and GND) for proper operation. Locate the capacitors close to the module.
- (7) 330 μF of output capacitance is required for proper operation. See the Application Information section for further guidance.
- (8) This is the typical ESR for all the electrolytic (nonceramic) capacitance. Use 17 m Ω as the minimum when using max-ESR values to calculate.

PIN ASSIGNMENT

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
GND	1, 7		This is the common ground connection for the V_I and V_O power connections. It is also the $0-V_{dc}$ reference for the <i>Inhibit</i> and V_O <i>Adjust</i> control inputs.
V_I	2	I	The positive input voltage power node to the module, which is referenced to common GND.
$\overline{\text{Inhibit}}$	3	I	The Inhibit pin is an open-collector/drain active-low input that is referenced to GND. Applying a low-level ground signal to this input disables the module's output and turns off the output voltage. When the Inhibit control is active, the input current drawn by the regulator is significantly reduced. If the Inhibit pin is left open-circuit, the module produces an output whenever a valid input source is applied.
V_O Adjust	4	I	A 1% resistor must be connected between this pin and GND (pin 7) to set the output voltage of the module. If left open-circuit, the output voltage is set to its default value. The temperature stability of the resistor should be 100 ppm/°C (or better). The standard resistor value for a number of common output voltages is provided in the application information.
V_O Sense	5	I	The sense input allows the regulation circuit to compensate for voltage drop between the module and the load. For optimum voltage accuracy, V_O Sense should be connected to V_O . If the sense feature is not used, this pin may be left disconnected.
V_O	6	O	The regulated positive power output with respect to the GND node.

APPLICATION INFORMATION

Adjusting the Output Voltage of the PTN78020x Series of Wide-Output Adjust Power Modules

General

A resistor must be connected between the V_O Adjust control (pin 4) and GND (pin 1) to set the output voltage. The adjustment range is from 2.5 V to 12.6 V for PTN78020W. The adjustment range is from 11.85 V to 22 V for PTN78020H. If pin 4 is left open, the output voltage defaults to the lowest value.

Table 2 gives the preferred value of the external resistor for a number of standard voltages, with the actual output voltage that the value provides. For other output voltages, the value of the required resistor can either be calculated using Equation 1 and the constants for the applicable product in Table 1. Figure 24 shows the placement of the required resistor.

$$R_{SET} = 54.9 \text{ k} \frac{1.25 \text{ V}}{V_O - V_{min}} - R_P \quad (1)$$

Table 1. R_{SET} Formula Constants

PRODUCT	V_{MIN}	R_P
PTN780x0W	2.5 V	6.49 k Ω
PTN780x0H	11.824 V	6.65 k Ω

Input Voltage Considerations

The PTN78020 is a step-down switching regulator. In order that the output remains in regulation, the input voltage must exceed the output by a minimum differential voltage.

Another consideration is the pulse width modulation (PWM) range of the regulator's internal control circuit. For stable operation, its operating duty cycle should not be lower than some minimum percentage. This defines the maximum advisable ratio between the regulator input and output voltage magnitudes.

As an example, for satisfactory performance, the operating input voltage range of the PTN78020x must adhere to the following requirements.

1. For PTN78020W output voltages lower than 10 V, the minimum input voltage is $(V_O + 2 \text{ V})$ or 7 V, whichever is higher.
2. For PTN78020W output voltages equal to 10 V and higher, the minimum input voltage is $(V_O + 2.5 \text{ V})$.
3. For PTN78020W, the maximum input voltage is $(10 \times V_O)$ or 36 V, whichever is less.
4. For PTN78020H output voltages lower than 19 V, the minimum input voltage is $(V_O + 3 \text{ V})$ or 15 V, whichever is higher.
5. For PTN78020H output voltages equal to 19 V and higher, the minimum input voltage is $(V_O + 4 \text{ V})$.

Table 2 gives the operating input voltage range for the common output bus voltages. In addition, the Electrical Characteristics table defines the available output voltage adjust range for various input voltages.

Table 2. Standard Values of R_{set} for Common Output Voltages

PRODUCT	V_O (Required)	R_{SET} (Standard Value)	V_O (Actual)	Operating V_I Range
PTN780x0W	2.5 V	Open	2.5 V	7 V to 25 V
	3.3 V	78.7 k Ω	3.306 V	7 V to 33 V
	5 V	21 k Ω	4.996 V	7 V to 36 V
	12 V	732 Ω	12.002 V	14.5 V to 36 V
PTN780x0H	12 V	383 k Ω	12.000 V	15 V to 36 V
	15 V	15 k Ω	14.994 V	18 V to 36 V
	18 V	4.42 k Ω	18.023 V	21 V to 36 V
	22 V	95.3	21.998 V	26 V to 36 V

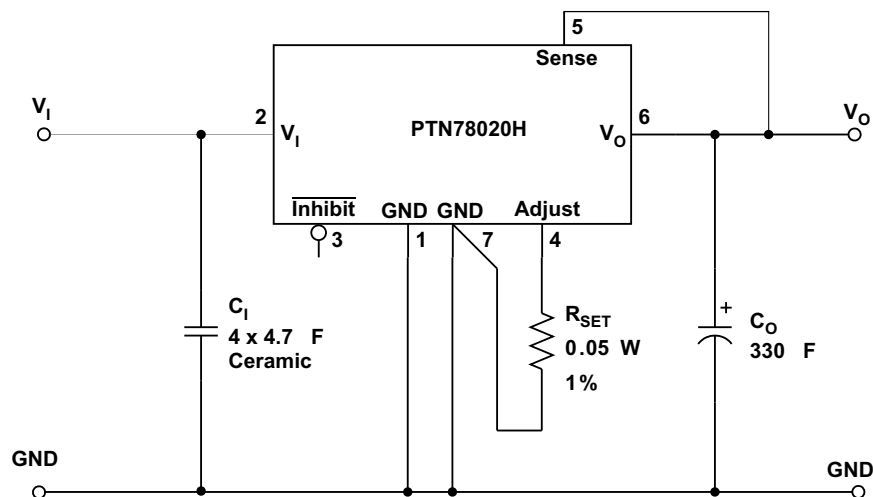

- (1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 4 and 1 using dedicated PCB traces.
- (2) Never connect capacitors from V_O Adjust to either GND or V_O . Any capacitance added to the V_O Adjust pin affects the stability of the regulator.

- (1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 4 and 1 using dedicated PCB traces.
- (2) Never connect capacitors from V_O Adjust to either GND or V_O . Any capacitance added to the V_O Adjust pin affects the stability of the regulator.

CAPACITOR RECOMMENDATIONS for the PTN78020 WIDE-OUTPUT ADJUST POWER MODULES

PTN78020W Input Capacitor

The minimum requirement for the input capacitance is a 2.2- μF ceramic capacitor for PTN78020W, in either a X5R or X7R temperature characteristic. Ceramic capacitors should be located within 0.5 inch (1,27 cm) of the regulator's input pins. Electrolytic capacitors can be used at the input, but only in addition to the required ceramic capacitance. The minimum ripple current rating for any nonceramic capacitance must be at least 500 mA rms for $V_O \leq 5.5$. For $V_O > 5.5$ V, the minimum ripple current rating is 750 mA rms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input. This ripple current requirement can be reduced by placing more ceramic capacitors at the input, in addition to the minimum required 2.2 μF .

Tantalum capacitors are not recommended for use at the input bus, as none were found to meet the minimum voltage rating of $2 \times$ (maximum dc voltage + ac ripple). This voltage derating is standard practice for regular tantalum capacitors to ensure reliability. Polymer-tantalum capacitors are more reliable, and are available with a maximum rating of typically 20 V. These can be used with input voltages up to 16 V.

PTN78020H Input Capacitor

The minimum requirement for PTN78020H the input capacitance is 18.8 μF (4x 4.7- μF) or equivalent . Ceramic capacitors should be located within 0.5 inch (1,27 cm) of the regulator's input pins. Electrolytic capacitors can be used at the input, but only in addition to the required ceramic capacitance. The minimum ripple current rating for any nonceramic capacitance must be at least 500 mA rms for $V_O \leq 5.5$. For $V_O > 5.5$ V, the minimum ripple current rating is 750 mA rms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input.

Tantalum capacitors are not recommended for use at the input bus, as none meet the minimum voltage rating of $2 \times$ (maximum dc voltage + ac ripple). This voltage derating is standard practice for regular tantalum capacitors to ensure reliability. Polymer-tantalum capacitors are more reliable, and are available with a maximum rating of typically 20 V. These can be used with input voltages up to 16 V.

PTN78020W/PTN78020H Output Capacitor

The minimum capacitance required to ensure stability is a 330 μF . Either ceramic or electrolytic-type capacitors can be used. The minimum ripple current rating for the nonceramic capacitance must be at least 250 mA rms. The stability of the module and voltage tolerances are compromised if the capacitor is not placed near the output bus pins. A high-quality, computer-grade electrolytic capacitor should be adequate. A ceramic capacitor can be also be located within 0.5 inch (1,27 cm) of the output pin.

For applications with load transients (sudden changes in load current), the regulator response improves with additional capacitance. Additional electrolytic capacitors should be located close to the load circuit. These capacitors provide decoupling over the frequency range, 2 kHz to 150 kHz. Aluminum electrolytic capacitors are suitable for ambient temperatures above 0°C. For operation below 0°C, tantalum or Os-Con type capacitors are recommended. When using one or more nonceramic capacitors, the calculated equivalent ESR should be no lower than 10 m Ω (17 m Ω using the manufacturer's maximum ESR for a single capacitor). A list of capacitors and vendors are identified in [Table 5](#) and [Table 6](#), the recommended capacitor tables.

Ceramic Capacitors

Above 150 kHz, the performance of aluminum electrolytic capacitors becomes less effective. To further reduce the reflected input ripple current, or the output transient response, multilayer ceramic capacitors must be added. Ceramic capacitors have low ESR and their resonant frequency is higher than the bandwidth of the regulator. When placed at the output, their combined ESR is not critical as long as the total value of ceramic capacitance does not exceed 300 μF . Also, to prevent the formation of local resonances, do not place more than three identical ceramic capacitors with values of 10 μF or greater in parallel.

Tantalum Capacitors

Tantalum-type capacitors may be used at the output, and are recommended for applications where the ambient operating temperature can be less than 0°C. The AVX TPS, Sprague 593D/594/595, and Kemet T495/T510/T520 capacitors series are suggested over many other tantalum types due to their rated surge, power dissipation, and ripple current capability. As a caution, many general-purpose tantalum capacitors have considerably higher ESR, reduced power dissipation, and lower ripple current capability. These capacitors are also less reliable as they have lower power dissipation and surge current ratings. Tantalum capacitors that do not have a stated ESR or surge current rating are not recommended for power applications. When specifying Os-Con and polymer-tantalum capacitors for the output, the minimum ESR limit is encountered well before the maximum capacitance value is reached.

Capacitor Table

The capacitor tables, [Table 5](#) and [Table 6](#), identifies the characteristics of capacitors from a number of vendors with acceptable ESR and ripple current (rms) ratings. The recommended number of capacitors required at both the input and output buses is identified for each capacitor type. This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The rms rating and ESR (at 100 kHz) are critical parameters necessary to ensure both optimum regulator performance and long capacitor life.

Designing for Load Transients

The transient response of the dc/dc converter has been characterized using a load transient with a di/dt of 1 A/μs. The typical voltage deviation for this load transient is given in the data sheet specification table using the required value of output capacitance. As the di/dt of a transient is increased, the response of a converter's regulation circuit ultimately depends on its output capacitor decoupling network. This is an inherent limitation of any dc/dc converter once the speed of the transient exceeds its bandwidth capability. If the target application specifies a higher di/dt or lower voltage deviation, the requirement can only be met with additional output capacitor decoupling. In these cases, special attention must be paid to the type, value, and ESR of the capacitors selected.

Power-Up Characteristics

When configured per the standard application, the PTN78020 power module produces a regulated output voltage following the application of a valid input source voltage. During power up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay (typically 5 ms – 10 ms) into the power-up characteristic. This is from the point that a valid input source is recognized. [Figure 26](#) shows the power-up waveforms for a PTN78020W, operating from a 12-V input and with the output voltage adjusted to 5 V. The waveforms were measured with a 1.5-A resistive load.

Figure 26. Power-Up Waveforms

Undervoltage Lockout

The undervoltage lockout (UVLO) circuit prevents the module from attempting to power up until the input voltage is above the UVLO threshold. This is to prevent the module from drawing excessive current from the input source at power up. Below the UVLO threshold, the module is held off.

Current-Limit Protection

The PTN78020 modules protect against load faults with a continuous current limit characteristic. Under a load fault condition, the output current cannot exceed the current limit value. Attempting to draw current that exceeds the current-limit value causes the module to progressively reduce its output voltage. Current is continuously supplied to the fault until it is removed. On removal of the fault, the output voltage promptly recovers. When limiting output current, the regulator experiences higher power dissipation, which increases its temperature. If the temperature increase is excessive, the module overtemperature protection begins to periodically turn the output voltage completely off.

Overtemperature Protection

A thermal shutdown mechanism protects the module's internal circuitry against excessively high temperatures. A rise in temperature may be the result of a drop in airflow, a high ambient temperature, or a sustained current limit condition. If the junction temperature of the internal control IC rises excessively, the module turns itself off, reducing the output voltage to zero. The module instantly restarts when the sensed temperature decreases by a few degrees.

Overtemperature protection is a last resort mechanism to prevent damage to the module. It should not be relied on as permanent protection against thermal stress. Always operate the module within its temperature derated limits, for the worst-case operating conditions of output current, ambient temperature, and airflow. Operating the module above these limits, albeit below the thermal shutdown temperature, reduces the long-term reliability of the module.

Output On/Off Inhibit

For applications requiring output voltage on/off control, the PTN78020 power module incorporates an output on/off Inhibit control (pin 3). The inhibit feature can be used wherever there is a requirement for the output voltage from the regulator to be turned off.

The power module functions normally when the Inhibit pin is left open-circuit, providing a regulated output whenever a valid source voltage is connected to V_I with respect to GND. Figure 27 shows the the circuit used to demonstrate the inhibit function. Note the discrete transistor (Q1). Turning Q1 on applies a low voltage to the *Inhibit* control pin and turns the module off. The output voltage decays as the load circuit discharges the capacitance. The current drawn at the input is reduced to typically 17 mA. If Q1 is then turned off, the module executes a soft-start power up. A regulated output voltage is produced within 20 ms. Figure 28 shows the typical rise in the output voltage, following the turn off of Q1. The turn off of Q1 corresponds to the fall in the waveform, $Q_1 V_{GS}$. The waveforms were measured with a 1.5-A resistive load.

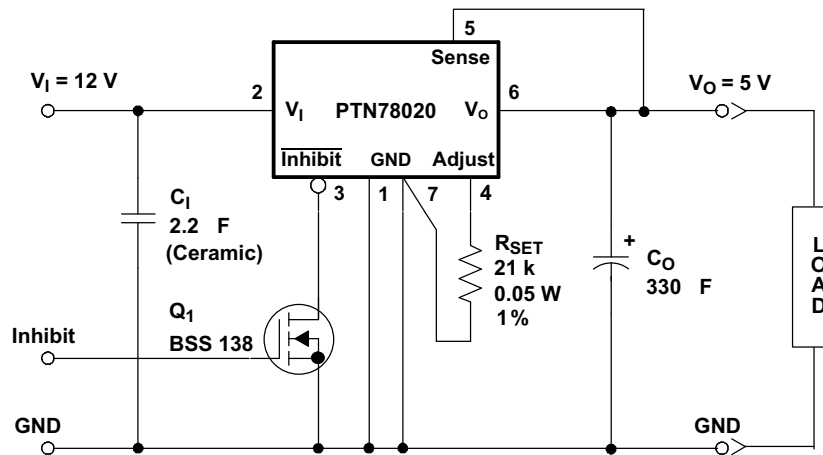

Figure 27. On/Off Inhibit Control Circuit

Figure 28. Power Up Response From Inhibit Control

Optional Input/Output Filters

Power modules include internal input and output ceramic capacitors in all of their designs. However, some applications require much lower levels of either input reflected or output ripple/noise. This application describes various filters and design techniques found to be successful in reducing both input and output ripple/noise.

Input/Output Capacitors

The easiest way to reduce output ripple and noise is to add one or more 1- μ F ceramic capacitors, such as C4 shown in Figure 29. Ceramic capacitors should be placed close to the output power terminals. A single 1- μ F capacitor reduces the output ripple/noise by 10% to 30% for modules with a rated output current of less than 3 A. (Note: C3 is required to improve the regulator transient response, and does not reduce output ripple and noise.)

Switching regulators draw current from the input line in pulses at their operating frequency. The amount of reflected (input) ripple/noise generated is directly proportional to the equivalent source impedance of the power source including the impedance of any input lines. The addition of C1, minimum 1- μ F ceramic capacitor, near the input power pins, reduces reflected conducted ripple/noise by 30% to 50%.

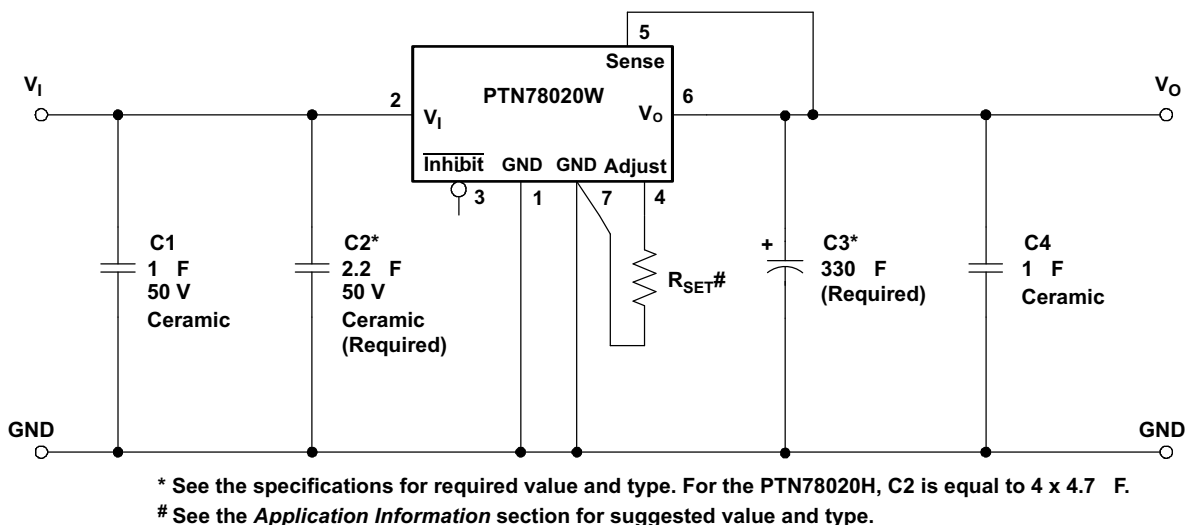

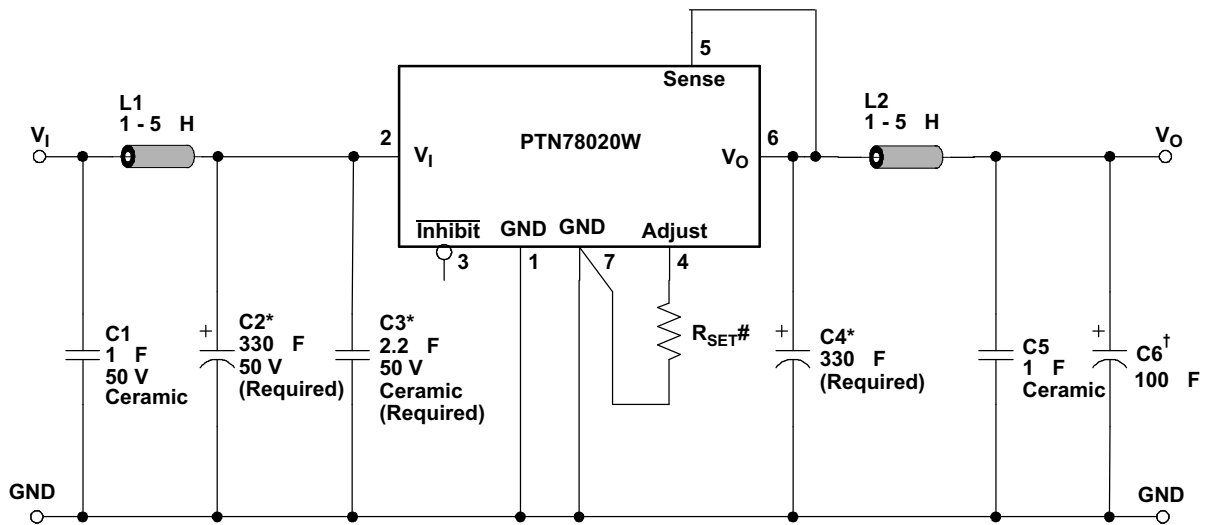

Figure 29. Adding High-Frequency Bypass Capacitors To The Input and Output

π Filters

If a further reduction in ripple/noise level is required for an application, higher order filters must be used. A π (pi) filter, employing a ferrite bead (Fair-Rite part number 2673000701 or equivalent) in series with the input or output terminals of the regulator reduces the ripple/noise by at least 20 db (see Figure 30 and Figure 31). In order for the inductor to be effective in reduction of ripple and noise, ceramic capacitors are required. (Note: see Capacitor Recommendations for the PTN78020W for additional information on vendors and component suggestions.)

These inductors plus ceramic capacitors form an excellent filter because of the rejection at the switching frequency (650 kHz - 1 MHz). The placement of this filter is critical. It must be located as close as possible to the input or output pins to be effective. The ferrite bead is small (12.5 mm \times 3 mm), easy to use, low cost, and has low dc resistance. Fair-Rite also manufactures a surface mount bead (part number 2773021447), through hole (part number 2673000701) rated to 5 A, but in this application, it is effective to 6 A on the output bus. 1- μ H to 5- μ H inductors can be used in place of the ferrite inductor bead.

* See the specifications for required value and type. For PTN78020H, C3 is equal to $4 \times 4.7 \text{ F}$.
 # See the *Application Information* section for suggested value and type.
 † Recommended whenever I_O is greater than 2 A.

PTN78020WAZT	ACTIVE	DIP MOD ULE	EUL	7	200	Pb-Free (RoHS)	Call TI	Level-3-260C-168 HR

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

EUK (R-PDSS-T7)

DOUBLE SIDED MODULE

- NOTES:
- A. All linear dimensions are in inches (mm).
 - B. This drawing is subject to change without notice.
 - C. 2 place decimals are ± 0.030 ($\pm 0,76$ mm).
 - D. 3 place decimals are ± 0.010 ($\pm 0,25$ mm).
 - E. Recommended keep out area for user components.

- E. Pins are 0.040" (1,02) diameter with 0.070" (1,78) diameter standoff shoulder.
- F. All pins: Material - Copper Alloy
Finish - Tin (100%) over Nickel plate

- NOTES: A. All linear dimensions are in inches (mm).
 B. This drawing is subject to change without notice.
 C. 2 place decimals are ± 0.030 (± 0.76 mm).
 D. 3 place decimals are ± 0.010 (± 0.25 mm).
 E. Recommended keep out area for user components.
 F. Power pin connection should utilize four or more vias to the interior power plane of 0.025 (0.63) I.D. per input, ground and output pin (or the electrical equivalent).

- G. Paste screen opening: 0.080 (2,03) to 0.085 (2,16).
 Paste screen thickness: 0.006 (0,15).
 H. Pad type: Solder mask defined.
 I. All pins: Material - Copper Alloy
 Finish - Tin (100%) over Nickel plate
 Solder Ball - See product data sheet.
 J. Dimension prior to reflow solder.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
