

## U74LVX4053

CMOS IC

### Triple 2-Channel Analog Multiplexer/Demultiplexer

#### DESCRIPTION

The **U74LVX4053** is a high speed, low-voltage drive analog multiplexer/demultiplexer using silicon gate CMOS technology. In 3V and 5V systems these can achieve high-speed operation with the low power dissipation that is a feature of CMOS.

The **U74LVX4053** offer analog/digital signal selection as well as mixed signals with a 4-Channel\*2 configuration.

The switches for each channel are turned on by the control pin digital signals.

Although the control signal logical amplitude ( $V_{CC}-GND$ ) is small, the device can perform large-amplitude ( $V_{CC}-V_{EE}$ ) signal switching.

For example, if  $V_{CC}=3V$ ,  $GND=0V$  and  $V_{EE}=-3V$ , signals between -3V and +3V can be switched from the logical circuit using a signal 3V power supply.

All input pins are equipped with a newly developed input protection circuit that avoids the need for a diode on the plus side (forward side from the input to the  $V_{CC}$ ). As a result, for example, 5V signals can be permitted on the inputs even when the power supply voltage to the circuits is off. As a result of this input power protection, the **U74LVX4053** can be used in a variety of applications, including in the system which has two power supplies, and in battery backup circuits.
