

FEATURES

- Wide V_{CC} operation voltage : 2.4V ~ 5.5V
- Very low power consumption :
 - $V_{CC} = 3.0V$ Operation current : 31mA (Max.) at 55ns
2mA (Max.) at 1MHz
Standby current : 4/8uA (Max.) at 70/85°C
 - $V_{CC} = 5.0V$ Operation current : 76mA (Max.) at 55ns
10mA (Max.) at 1MHz
Standby current : 25/50uA (Max.) at 70/85°C
- High speed access time :
 - 55 55ns (Max.) at $V_{CC} : 3.0\sim 5.5V$
 - 70 70ns (Max.) at $V_{CC} : 2.7\sim 5.5V$
- Automatic power down when chip is deselected
- Easy expansion with CE1, CE2 and OE options
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V

■ PIN DESCRIPTIONS

Name	Function
A0-A19 Address Input	These 20 address inputs select one of the 1,048,576 x 8-bit in the RAM
$\overline{\text{CE1}}$ Chip Enable 1 Input $\overline{\text{CE2}}$ Chip Enable 2 Input	$\overline{\text{CE1}}$ is active LOW and $\overline{\text{CE2}}$ is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and is in standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
$\overline{\text{WE}}$ Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{\text{WE}}$ is HIGH and $\overline{\text{OE}}$ is LOW, output data will be present on the DQ pins; when $\overline{\text{WE}}$ is LOW, the data present on the DQ pins will be written into the selected memory location.
$\overline{\text{OE}}$ Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{\text{OE}}$ is inactive.
DQ0-DQ7 Data Input/Output Ports	There 8 bi-directional ports are used to read data from or write data into the RAM.
V_{CC}	Power Supply
V_{SS}	Ground

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

2. -2.0V in case of AC pulse width less than 30 ns.

SWITCHING WAVEFORMS (READ CYCLE)

READ CYCLE 1 ^(1,2,4)

READ CYCLE 2 ^(1,3,4)

READ CYCLE 3 ^(1,4)

NOTES:

1. WE is high in read Cycle.
2. Device is continuously selected when $\overline{CE1} = V_{IL}$ and $CE2 = V_{IH}$.
3. Address valid prior to or coincident with $\overline{CE1}$ transition low and/or $CE2$ transition high.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 500\text{mV}$ from steady state with $C_L = 5\text{pF}$.
The parameter is guaranteed but not 100% tested.

■ SWITCHING WAVEFORMS (WRITE CYCLE)

WRITE CYCLE 1 ⁽¹⁾

WRITE CYCLE 2 ^(1,6)

NOTES:

1. $\overline{WE}$ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE1}$ and CE2 active and $\overline{WE}$ low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{wr} is measured from the earlier of CE1 or $\overline{WE}$ going high or CE2 going low at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the CE1 low transition or the CE2 high transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.
6. OE is continuously low (OE = V_{IL}).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE1 is low and CE2 is high during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm 500\text{mV}$ from steady state with $C_L = 5\text{pF}$.
The parameter is guaranteed but not 100% tested.
11. t_{cw} is measured from the later of $\overline{CE1}$ going low or CE2 going high to the end of write.
