Functional Description

The CY62147EV30 is a high performance CMOS static RAM organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra low active current. It is

ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected ($\overline{CE}$ HIGH or both BLE and BHE are HIGH). The input and output pins (IO₀ through IO₁₅) are placed in a high impedance state when:

- Deselected ($\overline{CE}$ HIGH)
- Outputs are disabled ($\overline{OE}$ HIGH)
- Both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH)
- Write operation is active ($\overline{CE}$ LOW and $\overline{WE}$ LOW)

To write to the device, take Chip Enable ($\overline{CE}$) and Write Enable ($\overline{WE}$) inputs LOW. If Byte Low Enable (BLE) is LOW, then data from IO pins (IO₀ through IO₇) is written into the location specified on the address pins (A₀ through A₁₇). If Byte High Enable (BHE) is LOW, then data from IO pins (IO₈ through IO₁₅) is written into the location specified on the address pins (A₀ through A₁₇).

To read from the device, take Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appear on IO₀ to IO₇. If Byte High Enable (BHE) is LOW, then data from memory appears on IO₈ to IO₁₅. See the [Truth Table](#) on page 9 for a complete description of read and write modes.

For best practice recommendations, refer to the Cypress application note [AN1064, SRAM System Guidelines](#).

Note

1. BGA packaged device is offered in single CE and dual CE options. In this data sheet, for a dual CE device, $\overline{CE}$ refers to the internal logical combination of $\overline{CE}_1$ and $\overline{CE}_2$ such that when $\overline{CE}_1$ is LOW and $\overline{CE}_2$ is HIGH, $\overline{CE}$ is LOW. For all other cases $\overline{CE}$ is HIGH.

Notes

12. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the [AC Test Load and Waveforms](#) on page 4.
13. AC timing parameters are subject to byte enable signals (BHE or BLE) not switching when chip is disabled. See application note [AN13842](#) for further clarification.
14. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
15. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
16. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE} = V_{IL}$, $\overline{BHE}$, $\overline{BLE}$, or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

Switching Waveforms

Figure 7. Read Cycle No. 2 ($\overline{\text{OE}}$ Controlled)^[1, 18, 19]

Notes

17. The device is continuously selected. $\overline{\text{OE}}$, $\overline{\text{CE}} = V_{\text{IL}}$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$, or both = V_{IL} .
18. WE is HIGH for read cycle.
19. Address valid before or similar to $\overline{\text{CE}}$ and $\overline{\text{BHE}}$, $\overline{\text{BLE}}$ transition LOW.

Notes

20. Data I/O is high impedance if $\overline{\text{OE}} = V_{IH}$.

21. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\text{WE} = V_{IH}$, the output remains in a high impedance state.

22. During this period, the IOs are in output state. Do not apply input signals.
