Pin Assignment

Pin function

Pin No.	Pin name	Pin function	Equivalent Circuit
1	V _{CC}	Power-supply voltage pin. V _{CC} voltage is impressed. The permissible operation voltage is from 4.0 to 16.0(V). The capacitor is connected for stabilization for GND pin (6pin).	
2	ENA	Motor drive control input pin. ENA pin becomes the stand-by mode in "L" and can 0 circuitry current. When ENA pin are "H", from the stand-by mode, the output state becomes an output corresponding to the input logic. It is a digital input, and the range of "L" level input is 0 to 0.7(V). The range of "H" level input is 1.8 to 5.5(V). With built-in pull-down resistance 100(kΩ).	
3	IN1	Motor drive control input pin. Driving control input pin of OUT1 (10pin) and OUT2 (9pin). With built-in pull-down resistance.	
4	IN2	Motor drive control input pin. Driving control input pin of OUT3 (8pin) and OUT4 (7pin). With built-in pull-down resistance.	
5	NC		
6	GND	Ground pin.	
7	OUT4	Driving output pin. The motor coil is connected between terminal OUT3 (8pin).	
8	OUT3	Driving output pin. The motor coil is connected between terminal OUT4 (7pin).	
9	OUT2	Driving output pin. The motor coil is connected between terminal OUT1 (10pin).	
10	OUT1	Driving output pin. The motor coil is connected between terminal OUT2 (9pin).	

Operation explanation

1. STM output control logic

Input			Output				State
ENA	IN1	IN2	OUT1	OUT2	OUT3	OUT4	
L	-	-	OFF	OFF	OFF	OFF	Stand-by
H	L	L	H	L	H	L	Step 1
	H	L	L	H	H	L	Step2
	H	H	L	H	L	H	Step3
	L	H	H	L	L	H	Step4

2. About the switch time from the stand-by state to the state of operation

This IC has completely stopped operating when ENA pin is "L". After the reset time of about 7 μ s internal settings it shifts to a prescribed output status corresponding to the state of the input when ENA pin is "H".

During reset time, all output TR OFF is maintained.

3. Example of current waveform at full-step mode.

4. Thermal shutdown function

The thermal shutdown circuit is incorporated and the output is turned off when junction temperature T_j exceeds 180°C. As the temperature falls by hysteresis, the output turned on again (automatic restoration).

The thermal shutdown circuit does not guarantee the protection of the final product because it operates when the temperature exceed the junction temperature of $T_{jmax}=150^{\circ}\text{C}$.

$TSD = 180^{\circ}\text{C}$ (typ)

$\Delta TSD = 40^{\circ}\text{C}$ (typ)

Applied circuit example

- * Bypass capacitor (C1) connected between VCC-GND of all examples of applied circuit recommends the electric field capacitor of 0.1 μ F to 10 μ F.
Confirm there is no problem in operation in the state of the motor load including the temperature property about the value of the capacitor.
Mount the position where the capacitor is mounted on nearest IC.
