High Speed LDO Regulator with ON/OFF Control

FEATURES

- **Output Current up to 150 mA (300 mA for IXD2109E/H type)**
- **Output Voltage Range from 0.9 V to 6.0 V with 0.05 V increments**
- **Output Voltage Accuracy ±2% (at V_{OUT} > 1.5 V), ± 30 mV (at V_{OUT} ≤ 1.5 V)**
- **Dropout Voltage 60 mV @ 30 mA , 0.20 V @ 100 mA**
- **Maximum Operating Voltage 10 V**
- **Low Power Consumption at 25 µA typical**
- **Standby Current less than 0.1 µA typical**
- **Ripple Rejection 70 dB at 10 kHz**
- **Low ESR Ceramic Capacitor compatible**
- **Operating Ambient Temperature - 40 + 85^{0}C**
- **Packages : SOT-25, SOT-89-5 , and USP-6B**
- **EU RoHS Compliant, Pb Free**

APPLICATIONS

- **Mobile phones**
- **Cameras, VCRs**
- **Various portable equipment**
- **Reference voltage source**

DESCRIPTION

The IXD1209/12 are a highly precise, low noise, positive voltage LDO regulators manufactured using CMOS processes. The IXD1209/12 have a high ripple rejection factor and low dropout. They consist of a voltage reference, an error amplifier, a current limiter, a phase compensation circuit, and a driver transistor.

Output voltage is selectable in 0.05V increments within a range of 0.9 V ~ 6.0 V.

The IXD1209/12 are compatible with low ESR ceramic capacitors, and due excellent transient response, they maintain stability even during significant load fluctuations. The current limiter's foldback circuit operates also as a short circuit protection.

The chip enable (CE) function allows disable IC, greatly reducing power consumption.

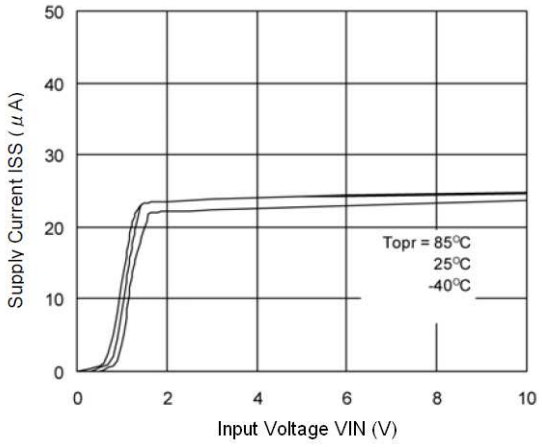

Regulator is available in SOT-25, SOT-89-5, and USP-6B packages.

ABSOLUTE MAXIMUM RATINGS

PARAMETER		SYMBOL	RATINGS	UNITS
Input Voltage		V_{IN}	– 0.3 ~ 12.0	V
Output Current		I_{OUT}	500[1)]	mA
Output Voltage		V_{OUT}	– 0.3 ~ V_{IN} + 0.3	V
CE Input Voltage		V_{CE}	– 0.3 ~ 12.0	V
Power Dissipation[2)]	SOT-25	P_D	250 (600 PCB mounted)	mW
	SOT-89-5		500 (1300 PCB mounted)	
	USP-6C		120 (1000 PCB mounted)	
Operating Temperature Range		T_{OPR}	– 40 ~ + 85	^{0}C
Storage Temperature Range		T_{STG}	– 55 ~ +125	^{0}C

All voltages are in respect to V_{SS}
1) $I_{OUT} \leq Pd/ (V_{IN}-V_{OUT})$
2)This is a reference data taken by using the test board. Please refer to page 21 to 23 for details.

PIN CONFIGURATION

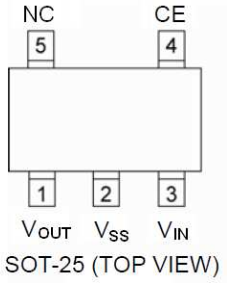

IXD1209

*The dissipation pad for the USP-6B package should be solder-plated in recommended mounting pattern and metal masking to enhance mounting strength and heat release.
If the pad needs to be connected to other pins, it should be connected to the V_{SS} (No.5) pin.

IXD1212

BASIC OPERATION

The Error Amplifier of the IXD1209/12 series monitors output voltage divided by internal resistors R1 & R2 and compares it with the internal Reference Voltage (see Block Diagram above). The output signal from error amplifier drives gate of the P-channel MOSFET, which is connected to the V_{OUT} pin and operates as a series voltage regulator.

The Current Limit and Short Protection circuits monitor level of the output current. The CE pin allows shutdown internal circuitry to minimize power consumption.

Low ESR Capacitors

An internal phase compensation circuit guarantees stable IXD1209/12 operation even if output capacitors with low ESR are used. However, connect the output capacitor C_L as close to the V_{OUT} and the V_{SS} pins as possible to prevent effectiveness of the phase compensation from degrade. The C_L capacitance value should be at least 1µF. In case the capacitor depends on the bias and temperature, make sure that actual capacitance is maintained at operating voltage and temperature range. In addition, an input capacitor $C_{IN} \geq 0.1\mu F$ between the V_{IN} and V_{SS} pins should be used to ensure a stable input power.

Current Limiter, Short-Circuit Protection

The IXD1209/12 series include a combination of a fixed current limiter circuit & a foldback circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit activates and output voltage drops. Because of this drop, the foldback circuit activates too, and output voltage drops further decreasing output current. When the output pin is shorted, a current of about 50 mA flows.

CE Pin

The CE pin allows shutdown internal circuitry to minimize power consumption. In shutdown mode, output at the V_{OUT} pin is pulled down to the V_{SS} level via R1 & R2. The operational logic of the CE pin is selectable (please, refer to the CE PIN FUNCTION Table above).

Note that the standard IXD1209/12B type CE input is an Active High/No Pull Down and operations will become unstable, if the CE pin is open. CE pin should be used with either V_{IN} or V_{SS} voltage. If this IC is used with some intermediate voltage at CE pin, supply current may increase due through current in the IC's internal circuitry.

TYPICAL APPLICATION CIRCUIT

The output capacitor $C_L \geq 1$ µF should be connected between the output pin (V_{OUT}) and the V_{SS} pin for stable regulator's operation. Ceramic capacitors with low ESR are recommended.

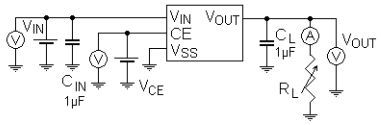

LAYOUT AND USE CONSIDERATIONS

1. Mount external component as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
2. The IC may malfunction if absolute maximum ratings are exceeded.
3. If power source of this regulator is a high impedance device with impedance of 10 Ω or more, an input capacitor $C_{IN} \geq 1\mu F$ should be used to prevent oscillations.
4. In case of high output current, increasing the input capacitor value can stabilize operations.
5. Oscillations may occur also, if the input capacitor value is not enough to reduce the input impedance and the output capacitor C_L is large. In such case, operations can be stabilized by either increasing the input capacitor or reducing the output capacitor.
6. During start-up, IC provides constant current until $V_{OUT} = V_{OUT\,(T)}$.
7. Please ensure that output current I_{OUT} is less than $P_D / (V_{IN} - V_{OUT})$, where P_D is a rated power dissipation value of the package shown at ABSOLUTE MAXIMUM RATING table to not exceed it.

2. Power Dissipation vs. Ambient Temperature

Board Mount (Tjmax = 125 ^{0}C)

Ambient Temperature, ^{0}C	Power Dissipation Pd, mW	Thermal Resistance, ^{0}C/W
25	1000	100.00
85	400
