

CCD area image sensor S9972/S9973 series

Front-illuminated FFT-CCD, high IR sensitivity

S9972/S9973 series are families of FFT-CCD image sensors specifically designed for low-light-level detection in scientific applications. By using the binning operation, S9972/S9973 series can be used as a linear image sensor having a long aperture in the direction of the device length. This makes S9972/S9973 series ideally suited for use in spectrophotometry. The binning operation offers significant improvement in S/N and signal processing speed compared with conventional methods by which signals are digitally added by an external circuit. S9972/S9973 series also feature low noise and low dark signal (MPP mode operation). This enables low-light-level detection and long integration time, thus achieving a wide dynamic range.

S9972/S9973 series have an effective pixel size of $24 \times 24 \mu\text{m}$ and are available in image areas of $24.576 \text{ (H)} \times 2.976 \text{ (V)} \text{ mm}^2$ (1024×124 pixels) and $24.576 \text{ (H)} \times 6.048 \text{ (V)} \text{ mm}^2$ (1024×252 pixels). S9972/S9973 series are pin compatible with S9970/S9971 series. (Operating conditions and characteristics are a little bit different from S9970/S9971 series.)

Features

- $1024 \text{ (H)} \times 124 \text{ (V)}$ and $1024 \text{ (H)} \times 252 \text{ (V)}$ pixel format
- Pixel size: $24 \times 24 \mu\text{m}$
- Line/pixel binning
- 100 % fill factor
- Wide dynamic range
- Low dark signal
- Low readout noise
- MPP operation
- High IR sensitivity

Applications

- Fluorescence spectrometer, ICP
- Raman spectrometer
- Industrial inspection requiring
- Semiconductor inspection
- DNA sequencer
- Low-light-level detection

■ Specifications of built-in TE-cooler (Typ.)

Parameter	Symbol	Condition	S9973-1007	S9973-1008	Unit
Internal resistance	R _{int}	T _a =25 °C	6.0	1.2	Ω
Maximum current *16	I _{max}	T _c *17=T _h *18=25 °C	1.5	3.0	A

Maximum heat absorption *19	Q _{max}		6.7	5.1	W
Maximum temperature of hot side	-		70		°C

*16: Maximum current I_{max}:

If the current is greater than I_{max}, the heat absorption begins to decrease due to the Joule heat. It should be noted that this value is not a damage threshold. To protect the thermoelectric cooler and maintain stable operation, the supply current should be less than 60 % of this maximum current.

*17: Temperature of cool side of thermoelectric cooler

*18: Temperature of hot side of thermoelectric cooler

*19: Maximum heat absorption Q_{max}

This is a heat absorption when the maximum current is supplied to the TE-cooler.

■ Specifications of built-in temperature sensor

A chip thermistor is built in the same package with a CCD chip, and the CCD chip temperature can be monitored with it. A relation between the thermistor resistance and absolute temperature is expressed by the following equation.

$$R1 = R2 \times \exp B (1 / T1 - 1 / T2)$$

where R1 is the resistance at absolute temperature T1 (K)

R2 is the resistance at absolute temperature T2 (K)

B is so-called the B constant (K)

The characteristics of the thermistor used are as follows.

$$R (298K) = 10 \text{ k}\Omega$$

$$B (298K / 323K) = 3450 \text{ K}$$

■ Precaution for use (Electrostatic countermeasures)

- Handle these sensors with bare hands or wearing cotton gloves. In addition, wear anti-static clothing or use a wrist strap, in order to prevent electrostatic damage due to electrical charges from friction.
- Avoid directly placing these sensors on a work-desk or work-bench that may carry an electrostatic charge.
- Provide ground lines or ground connection with the work-floor, work-desk and work-bench to allow static electricity to discharge.
- Ground the tools used to handle these sensors, such as tweezers and soldering irons.

It is not always necessary to provide all the electrostatic measures stated above. Implement these measures according to the amount of damage that occurs.

■ Element cooling/heating temperature incline rate

When cooling the CCD by an externally attached cooler, set the cooler operation so that the temperature gradient (rate of temperature change) for cooling or allowing the CCD to warm back is less than 5 K/minute.
