

LMK1D210x Low Additive Jitter LVDS Buffer

1 Features

- High-performance LVDS clock buffer family: up to 2 GHz
 - Dual 1:6 differential buffer
 - Dual 1:8 differential buffer
- Supply voltage: 1.71 V to 3.465 V
- Low additive jitter: < 60 fs RMS maximum in 12-kHz to 20-MHz at 156.25 MHz
 - Very low phase noise floor: -164 dBc/Hz (typical)
- Very low propagation delay: < 575 ps maximum
- Output skew: 20 ps maximum
- High-swing LVDS (boosted mode): 500-mV VOD typical when AMP_SEL = 1
- Bank enable/disable using the EN pin
- Universal inputs accept LVDS, LVPECL, LVCMOS, HCSL and CML signal levels
- LVDS reference voltage, V_{AC_REF} , available for capacitive-coupled inputs
- Industrial temperature range: -40°C to 105°C
- Packaged in
 - LMK1D2106: 6-mm × 6-mm, 40-pin VQFN (RHA)
 - LMK1D2108: 7-mm × 7-mm, 48-pin VQFN (RGZ)

2 Applications

- [Telecommunications and networking](#)
- [Medical imaging](#)
- [Test and measurement](#)
- [Wireless infrastructure](#)
- [Pro audio, video and signage](#)

3 Description

The LMK1D210x clock buffer distributes two clock inputs (IN0 and IN1) to a total of 16 pairs of differential LVDS clock outputs (OUT0 to OUT15) in the LMK1D2108 and 12 pairs of clock outputs (OUT0 to OUT11) in the LMK1D2106 with minimum skew for clock distribution. Each buffer block consists of one input and a maximum of 6 (LMK1D2106) or 8 (LMK1D2108) LVDS outputs. The inputs can either be LVDS, LVPECL, HCSL, CML, or LVCMOS.

The LMK1D210x is specifically designed for driving 50-Ω transmission lines. When driving inputs in single-ended mode, apply the appropriate bias voltage to the unused negative input pin (see [Figure 8-6](#)).

Using the control pin (EN), output banks can either be enable or disabled. If this pin is left open, both bank outputs are enabled. If the control pin is switched to a logic "0", both bank outputs are disabled (static logic "0"). If the control pin is switched to a logic "1", the outputs of one bank are disabled while the outputs of the other bank are enabled. The part also supports a fail-safe function. The device further incorporates an input hysteresis which prevents random oscillation of the outputs in the absence of an input signal.

The device operates in a 1.8-V, 2.5-V, or 3.3-V supply environment and is characterized from -40°C to 105°C (ambient temperature).

Device Information

PART NUMBER ⁽¹⁾	PACKAGE	BODY SIZE (NOM)
LMK1D2106	VQFN (40)	6.00 mm × 6.00 mm
LMK1D2108	VQFN (48)	7.00 mm × 7.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Figure 5-1. LMK1D2106: RHA Package 40-Pin VQFN Top View

Figure 5-2. LMK1D2108: RGZ Package 48-Pin VQFN Top View

Table 5-1. Pin Functions

PIN			TYPE ⁽¹⁾	DESCRIPTION
NAME	LMK1D2106	LMK1D2108		
DIFFERENTIAL/SINGLE-ENDED CLOCK INPUT				
IN0_P, IN0_N	8, 9	9, 10	I	Primary: Differential input pair or single-ended input
IN1_P, IN1_N	2, 3	3, 4	I	Secondary: Differential input pair or single-ended input
				Note that INP0, INN0 are used indistinguishably with IN0_P, IN0_N.
BANK ENABLE				
EN	1	2	I	Output bank enable/disable with an internal 500-kΩ pullup and 320-kΩ pulldown. See Table 8-2 .
AMPLITUDE SELECT				
AMP_SEL	10	11	I	Output amplitude swing select with an internal 500-kΩ pullup and 320-kΩ pulldown. See Table 8-3 .
BIAS VOLTAGE OUTPUT				
V _{AC_REF0} , V _{AC_REF1}	7, 4	8, 5	O	Bias voltage output for capacitive coupled inputs. If used, TI recommends using a 0.1-μF capacitor to GND on this pin.
DIFFERENTIAL CLOCK OUTPUT				
OUT0_P, OUT0_N	12, 13	14, 15	O	Differential LVDS output pair number 0
OUT1_P, OUT1_N	14, 15	16, 17	O	Differential LVDS output pair number 1
OUT2_P, OUT2_N	16, 17	18, 19	O	Differential LVDS output pair number 2
OUT3_P, OUT3_N	18, 19	20, 21	O	Differential LVDS output pair number 3
OUT4_P, OUT4_N	22, 23	22, 23	O	Differential LVDS output pair number 4
OUT5_P, OUT5_N	24, 25	25, 26	O	Differential LVDS output pair number 5
OUT6_P, OUT6_N	26, 27	27, 28	O	Differential LVDS output pair number 6
OUT7_P, OUT7_N	28, 29	29, 30	O	Differential LVDS output pair number 7
OUT8_P, OUT8_N	32, 33	31, 32	O	Differential LVDS output pair number 8

Table 5-1. Pin Functions (continued)

NAME	PIN		TYPE ⁽¹⁾	DESCRIPTION
	LMK1D2106	LMK1D2108		
OUT9_P, OUT9_N	34, 35	33, 34	O	Differential LVDS output pair number 9
OUT10_P, OUT10_N	36, 37	35, 36	O	Differential LVDS output pair number 10
OUT11_P, OUT11_N	38, 39	38, 39	O	Differential LVDS output pair number 11
OUT12_P, OUT12_N	—	40, 41	O	Differential LVDS output pair number 12
OUT13_P, OUT13_N	—	42, 43	O	Differential LVDS output pair number 13
OUT14_P, OUT14_N	—	44, 45	O	Differential LVDS output pair number 14
OUT15_P, OUT15_N	—	46, 47	O	Differential LVDS output pair number 15
SUPPLY VOLTAGE				
V _{DDA}	6, 11, 20	7, 13, 24	P	Device power supply (1.8 V, 2.5 V, or 3.3 V) for Bank 0
V _{ddb}	5, 31, 40	6, 37, 48	P	Device power supply (1.8 V, 2.5 V, or 3.3 V) for Bank 1
GROUND				
GND	21, 30	1, 12	G	Ground
MISC				
DAP	DAP	DAP	G	Die Attach Pad. Connect to the printed circuit board (PCB) ground plane for heat dissipation.

(1) G = Ground, I = Input, O = Output, P = Power

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{DD}	Supply voltage	−0.3	3.6	V
V _{IN}	Input voltage	−0.3	3.6	V
V _O	Output voltage	−0.3	V _{DD} + 0.3	V
I _{IN}	Input current	−20	20	mA
I _O	Continuous output current	−50	50	mA
T _J	Junction temperature		135	°C
T _{stg}	Storage temperature ⁽²⁾	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Device unpowered

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±3000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V _{DD}	Core supply voltage	3.3-V supply	3.135	3.3	3.465	V
		2.5-V supply	2.375	2.5	2.625	
		1.8-V supply	1.71	1.8	1.89	
Supply Ramp	Supply voltage ramp	Requires monotonic ramp (10-90 % of V _{DD})	0.1		20	ms
T _A	Operating free-air temperature		–40		105	°C
T _J	Operating junction temperature		–40		135	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMK1D2106	LMK1D2108	UNIT
		RHA (VQFN)	RGZ (VQFN)	
		40 PINS	48 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	30.3	30.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	21.6	21.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	13.1	12.9	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.4	0.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	13	12.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	4.5	4.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

V_{DD} = 1.8 V ± 5 %, –40°C ≤ T_A ≤ 105°C. Typical values are at V_{DD} = 1.8 V, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY CHARACTERISTICS						
IDD _{STAT}	Core supply current, static (LMK1D2106)	All outputs enabled and unterminated, f = 0 Hz, AMP_SEL = Open (default)	75		mA	
IDD _{STAT}	Core supply current, static (LMK1D2108)	All outputs enabled and unterminated, f = 0 Hz, AMP_SEL = Open (default)	80		mA	
IDD _{100M}	Core supply current (LMK1D2106)	All outputs enabled, RL = 100 Ω, f =100 MHz, AMP_SEL = Open (default)	113	140	mA	
IDD _{100M}	Core supply current (LMK1D2108)	All outputs enabled, RL = 100 Ω, f =100 MHz, AMP_SEL = Open (default)	134	160	mA	
IDD _{STAT}	Core supply current, static (LMK1D2106)	All outputs enabled and unterminated, f = 0 Hz, AMP_SEL = 1	75		mA	
IDD _{STAT}	Core supply current, static (LMK1D2108)	All outputs enabled and unterminated, f = 0 Hz, AMP_SEL = 1	80		mA	
IDD _{100M}	Core supply current (LMK1D2106)	All outputs enabled, RL = 100 Ω, f =100 MHz, AMP_SEL = 1	130	165	mA	
IDD _{100M}	Core supply current (LMK1D2108)	All outputs enabled, RL = 100 Ω, f =100 MHz, AMP_SEL = 1	185		mA	
EN/AMP_SEL CONTROL INPUT CHARACTERISTICS (Applies to V _{DD} = 1.8 V ± 5%, 2.5 V ± 5% and 3.3 V ± 5%)						
Vd _{i3}	Tri-state input	Open	0.4 × V _{CC}			V

$V_{DD} = 1.8 \text{ V} \pm 5\%$, $-40^{\circ}\text{C} \leq T_A \leq 105^{\circ}\text{C}$. Typical values are at $V_{DD} = 1.8 \text{ V}$, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IH}	Input high voltage	Minimum input voltage for a logical "1" state in table 1	$0.7 \times V_{CC}$		$V_{CC} + 0.3$	V
V_{IL}	Input low voltage	Maximum input voltage for a logical "0" state in table 1	-0.3		$0.3 \times V_{CC}$	V
I_{IH}	Input high current	V_{DD} can be 1.8V, 2.5V, or 3.3V with $V_{IH} = V_{DD}$			30	uA
I_{IL}	Input low current	V_{DD} can be 1.8V, 2.5V, or 3.3V with $V_{IH} = V_{DD}$	-30			uA
$R_{pull-up}$	Input pullup resistor			500		k Ω
$R_{pull-down}$	Input pulldown resistor			320		k Ω

SINGLE-ENDED LVCMOS/LVTTL CLOCK INPUT (Applies to $V_{DD} = 1.8 \text{ V} \pm 5\%$, $2.5 \text{ V} \pm 5\%$ and $3.3 \text{ V} \pm 5\%$)

f_{IN}	Input frequency	Clock input	DC		250	MHz
V_{IN_S-E}	Single-ended Input Voltage Swing	Assumes a square wave input with two levels	0.4		3.465	V
dV_{IN}/dt	Input Slew Rate (20% to 80% of the amplitude)		0.05			V/ns
I_{IH}	Input high current	$V_{DD} = 3.465 \text{ V}$, $V_{IH} = 3.465 \text{ V}$			60	uA
I_{IL}	Input low current	$V_{DD} = 3.465 \text{ V}$, $V_{IL} = 0 \text{ V}$	-30			uA
C_{IN_SE}	Input capacitance	at 25°C		3.5		pF

DIFFERENTIAL CLOCK INPUT (Applies to $V_{DD} = 1.8 \text{ V} \pm 5\%$, $2.5 \text{ V} \pm 5\%$ and $3.3 \text{ V} \pm 5\%$)

f_{IN}	Input frequency	Clock input			2	GHz
$V_{IN_DIFF(P-P)}$	Differential input voltage peak-to-peak $\{2 \times (V_{INP} - V_{INN})\}$	$V_{ICM} = 1 \text{ V}$ ($V_{DD} = 1.8 \text{ V}$)	0.3		2.4	V_{PP}
		$V_{ICM} = 1.25 \text{ V}$ ($V_{DD} = 2.5 \text{ V}/3.3 \text{ V}$)	0.3		2.4	
V_{ICM}	Input common-mode voltage	$V_{IN_DIFF(P-P)} > 0.4 \text{ V}$ ($V_{DD} = 1.8 \text{ V}/2.5 \text{ V}/3.3 \text{ V}$)	0.25		2.3	V
I_{IH}	Input high current	$V_{DD} = 3.465 \text{ V}$, $V_{INP} = 2.4 \text{ V}$, $V_{INN} = 1.2 \text{ V}$			30	uA
I_{IL}	Input low current	$V_{DD} = 3.465 \text{ V}$, $V_{INP} = 0 \text{ V}$, $V_{INN} = 1.2 \text{ V}$	-30			uA
C_{IN_SE}	Input capacitance (Single-ended)	at 25°C		3.5		pF

LVDS DC OUTPUT CHARACTERISTICS

$ V_{OD} $	Differential output voltage magnitude $ V_{OUTP} - V_{OUTN} $	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$	250	350	450	mV
$ V_{OD} $	Differential output voltage magnitude $ V_{OUTP} - V_{OUTN} $	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$, $AMP_SEL = 1$	400	500	650	mV
ΔV_{OD}	Change in differential output voltage magnitude	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$	-15		15	mV
ΔV_{OD}	Change in differential output voltage magnitude	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$, $AMP_SEL = 1$	-20		20	mV
$V_{OC(SS)}$	Steady-state, common-mode output voltage	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$ ($V_{DD} = 1.8 \text{ V}$)	1		1.2	V
		$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$ ($V_{DD} = 2.5 \text{ V}/3.3 \text{ V}$)	1.1		1.375	
$V_{OC(SS)}$	Steady-state, common-mode output voltage	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$ ($V_{DD} = 1.8 \text{ V}$), $AMP_SEL = 1$	0.8		1.05	V
		$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$ ($V_{DD} = 2.5 \text{ V}/3.3 \text{ V}$), $AMP_SEL = 1$	0.9		1.15	
$\Delta V_{OC(SS)}$	Change in steady-state, common-mode output voltage	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$	-15		15	mV
$\Delta V_{OC(SS)}$	Change in steady-state, common-mode output voltage	$V_{IN_DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$, $AMP_SEL = 1$	-20		20	mV

$V_{DD} = 1.8 \text{ V} \pm 5\%$, $-40^\circ\text{C} \leq T_A \leq 105^\circ\text{C}$. Typical values are at $V_{DD} = 1.8 \text{ V}$, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LVDS AC OUTPUT CHARACTERISTICS						
V_{ring}	Output overshoot and undershoot	$V_{IN,DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$, $f_{OUT} = 491.52 \text{ MHz}$	-0.1		0.1	V_{OD}
V_{OS}	Output AC common-mode voltage	$V_{IN,DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$		50	100	mV_{pp}
V_{OS}	Output AC common-mode voltage	$V_{IN,DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$, $AMP_SEL = 1$		75	150	mV_{pp}
I_{OS}	Short-circuit output current (differential)	$V_{OUTP} = V_{OUTN}$	-12		12	mA
$I_{OS(cm)}$	Short-circuit output current (common-mode)	$V_{OUTP} = V_{OUTN} = 0$	-24		24	mA
t_{PD}	Propagation delay	$V_{IN,DIFF(P-P)} = 0.3 \text{ V}$, $R_{LOAD} = 100 \Omega$ ⁽¹⁾	0.3		0.575	ns
$t_{SK, O}$	Output skew	Skew between outputs with the same load conditions (12 and 16 channels) ⁽²⁾			20	ps
$t_{SK, b}$	Output bank skew	Skew between the outputs within the same bank (2106/2108) ⁽³⁾			17.5	ps
$t_{SK, PP}$	Part-to-part skew	Skew between outputs on different parts subjected to the same operating conditions with the same input and output loading.			200	ps
$t_{SK, P}$	Pulse skew	50% duty cycle input, crossing point-to-crossing-point distortion ⁽⁴⁾	-20		20	ps
$t_{RJIT(ADD)}$	Random additive Jitter (rms)	$f_{IN} = 156.25 \text{ MHz}$ with 50% duty-cycle, Input slew rate = 1.5 V/ns , Integration range = 12 kHz to 20 MHz , with output load $R_{LOAD} = 100 \Omega$		45	60	fs, RMS
Phase noise	Phase Noise for a carrier frequency of 156.25 MHz with 50% duty-cycle, Input slew rate = 1.5 V/ns with output load $R_{LOAD} = 100 \Omega$	PN_{1kHz}		-143		dBc/Hz
		PN_{10kHz}		-150		
		PN_{100kHz}		-157		
		PN_{1MHz}		-160		
		PN_{floor}		-164		
SPUR	Spurious suppression between dual banks	$F_{IN0} = 491.52 \text{ MHz}$, $F_{IN1} = 61.44 \text{ MHz}$; Measured between neighboring outputs		-60		dB
		$F_{IN0} = 491.52 \text{ MHz}$, $F_{IN1} = 15.36 \text{ MHz}$; Measured between neighboring outputs		-70		
ODC	Output duty cycle	With 50% duty cycle input	45		55	%
t_R/t_F	Output rise and fall time	20% to 80% with $R_{LOAD} = 100 \Omega$			300	ps
t_R/t_F	Output rise and fall time	20% to 80% with $R_{LOAD} = 100 \Omega$ ($AMP_SEL = 1$)			300	ps
V_{AC_REF}	Reference output voltage	$V_{DD} = 2.5 \text{ V}$, $I_{LOAD} = 100 \mu\text{A}$	0.9	1.25	1.375	V
POWER SUPPLY NOISE REJECTION (PSNR) $V_{DD} = 2.5 \text{ V}/3.3 \text{ V}$						
PSNR	Power Supply Noise Rejection ($f_{carrier} = 156.25 \text{ MHz}$)	10 kHz, 100 mVpp ripple injected on V_{DD}		-70		dBc
		1 MHz, 100 mVpp ripple injected on V_{DD}		-50		

(1) Measured between single-ended/differential input crossing point to the differential output crossing point.

(2) For the dual bank devices, the inputs are phase aligned and have 50% duty cycle.

(3) Applies to the dual bank family.

- (4) Defined as the magnitude of the time difference between the high-to-low and low-to-high propagation delay times at an output.

6.6 Typical Characteristics

Figure 6-1 (LMK1D2106) and Figure 6-3 (LMK1D2108) capture the variation of the current consumption with input frequency and supply voltage when AMP_SEL = 0. Figure 6-2 (LMK1D2106) and Figure 6-4 (LMK1D2108) show the current consumption variation when AMP_SEL = 1. Figure 6-5 and Figure 6-6 portray the variation of the differential output voltage (VOD) swept across frequency.

8 Detailed Description

8.1 Overview

The LMK1D210x LVDS drivers use CMOS transistors to control the output current. Therefore, proper biasing and termination are required to ensure correct operation of the device and to maximize signal integrity.

The proper LVDS termination for signal integrity over two 50-Ω lines is 100 Ω between the outputs on the receiver end. Either DC-coupled termination or AC-coupled termination can be used for LVDS outputs. TI recommends placing a termination resistor close to the receiver. If the receiver is internally biased to a voltage different than the output common-mode voltage of the LMK1D210x, AC coupling must be used. If the LVDS receiver has internal 100-Ω termination, external termination must be omitted.

8.2 Functional Block Diagram

8.3 Feature Description

The LMK1D210x is a low additive jitter LVDS fan-out buffer that can generate up to 6 (LMK1D2106) or 8 (LMK1D2108) LVDS copies of a single input that is either LVDS, LVPECL, HCSL, CML, or LVCMOS on each of its banks. The device has two banks, therefore this translates to a total of 12 (LMK1D2106) or 16 (LMK1D2108) pairs of outputs. Refer to the [Table 8-1](#) for output bank mapping. The reference clock frequencies can go up to 2 GHz.

Table 8-1. Output Bank

Bank	LMK1D2106	LMK1D2108
0	OUT0 to OUT5	OUT0 to OUT7
1	OUT6 to OUT11	OUT8 to OUT15

Apart from providing a very low additive jitter and low output skew, the LMK1D210x has an output bank enable/disable control pin (EN) and an output amplitude control pin (AMP_SEL).

8.4 Device Functional Modes

The output banks of the LMK1D210x can be selected through the control pin (see [Table 8-2](#)). Unused inputs can be left floating to reduce overall component cost. Both AC- and DC-coupling schemes can be used with the LMK1D210x to provide greater system flexibility.

Table 8-2. Output Control

EN	CLOCK OUTPUTS
0	All bank outputs disabled (static logic "0")
1	Bank 0 outputs enabled and Bank 1 outputs disabled
OPEN	All bank outputs enabled

The output amplitude of the banks of the LMK1D210x can be selected through the amplitude selection pin (see [Table 8-3](#)). The higher output amplitude mode (boosted swing LVDS mode) can be used in applications which require higher amplitude either for better noise performance (higher slew rate) or if the receiver has swing requirements which the standard LVDS swing cannot meet.

Table 8-3. Amplitude Selection

AMP_SEL	OUTPUT AMPLITUDE (mV)
0	Bank 0: boosted LVDS swing (500 mV) Bank 1: standard LVDS swing (350 mV)
OPEN	Bank 0: standard LVDS swing (350 mV) Bank 1: standard LVDS swing (350 mV)
1	Bank 0: boosted LVDS swing (500 mV) Bank 1: boosted LVDS swing (500 mV)

8.4.1 LVDS Output Termination

TI recommends unused outputs to be terminated differentially with a 100-Ω resistor for optimum performance, although unterminated outputs are also okay but will result in slight degradation in performance (Output AC common-mode V_{OS}) in the outputs being used.

The LMK1D210x can be connected to LVDS receiver inputs with DC and AC coupling as shown in [Figure 8-1](#) and [Figure 8-2](#), respectively.

Figure 8-1. Output DC Termination

Figure 8-2. Output AC Termination (With the Receiver Internally Biased)

8.4.2 Input Termination

The LMK1D210x inputs can be interfaced with LVDS, LVPECL, HCSL, or LVCMOS drivers.

LVDS drivers can be connected to LMK1D210x inputs with DC and AC coupling as shown [Figure 8-3](#) and [Figure 8-4](#), respectively.

Figure 8-3. LVDS Clock Driver Connected to LMK1D210x Input (DC-Coupled)

Figure 8-4. LVDS Clock Driver Connected to LMK1D210x Input (AC-Coupled)

[Figure 8-5](#) shows how to connect LVPECL inputs to the LMK1D210x. The series resistors are required to reduce the LVPECL signal swing if the signal swing is $>1.6 V_{PP}$.

Figure 8-5. LVPECL Clock Driver Connected to LMK1D210x Input

Figure 8-6 shows how to couple a LVCMOS clock input to the LMK1D210x directly.

Figure 8-6. 1.8-V, 2.5-V, or 3.3-V LVCMOS Clock Driver Connected to LMK1D210x Input

For unused input, TI recommends grounding both input pins (INP, INN) using 1-kΩ resistors.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The LMK1D210x is a low additive jitter universal to LVDS fan-out buffer with dual inputs which fan-out to dual outputs banks. Each input can fan-out to six outputs in case of LMK1D2106 and eight outputs in case of LMK1D2108. The small package size, 1.8-V power supply operation, low output skew, and low additive jitter is designed for applications that require high-performance clock distribution as well as for low-power and space-constraint applications.

9.2 Typical Application

Figure 9-1. Fan-Out Buffer for ADC Device Clock and SYSREF Distribution

9.2.1 Design Requirements

The LMK1D210x shown in [Figure 9-1](#) is configured to fan-out an ADC clock on the first output bank and SYSREF clock on the second output bank for a system using the JESD204B/C ADC. The low output-to-output skew, very low additive jitter and superior spurious suppression between dual banks makes the LMK1D210x a simple, robust and low-cost solution for distributing various clocks to JESD204B/C AFE systems. The configuration example can drive up to 4 ADC clocks and 4 SYSREF clocks for a JESD204B/C receiver with the following properties:

- The ADC clock receiver module is typically AC-coupled with an LVDS driver such as the LMK1D210x due to differences in common-mode voltage between the driver and receiver. Depending on the receiver, there may be an option for internal 100-Ω differential termination in which case an external termination would not be required for the LMK1D210x.
- The SYSREF clock receiver module is typically DC-coupled provided the common-mode voltage of the LMK1D210x outputs match with the receiver. An external termination may not be needed in case of an internal termination in the receiver.
- Unused outputs of the LMK1D210x device are terminated differentially with a 100-Ω resistor for optimum performance.

9.2.2 Detailed Design Procedure

See [Input Termination](#) for proper input terminations, dependent on single-ended or differential inputs.

See [LVDS Output Termination](#) for output termination schemes depending on the receiver application.

TI recommends unused outputs to be terminated differentially with a 100- Ω resistor for optimum performance, although unterminated outputs are also okay but will result in slight degradation in performance (Output AC common-mode V_{OS}) in the outputs being used.

In this application example, the ADC clock and SYSREF clocks require different output interfacing schemes. Power-supply filtering and bypassing is critical for low-noise applications.

In case of common-mode mismatch between the output voltage of the LMK1D210x and the receiver, one can use AC coupling to get around this. It might not be possible in certain applications, however, to AC-couple the LMK1D210x outputs to the receiver due to the settling time associated with this AC-coupling network (High-pass filter), which can result in non-deterministic behavior during the initial transients. For such applications, DC-coupling the outputs is necessary and thus requires a scheme which can overcome the inherent mismatch between the common-mode voltage of the driver and receiver.

The application report [Interfacing LVDS Driver With a Sub-LVDS Receiver](#) discusses how to interface between a LVDS driver and sub-LVDS receiver. The same concept can be applied to interface the LMK1D210x outputs to a receiver which has a lower common-mode voltage.

Figure 9-2. Schematic for DC-Coupling LMK1D21xx With Lower Common-Mode Receiver

Figure 9-2 shows the resistor divider network for stepping down the common-mode voltage as explained in the above application report. The resistors R1, R2 and R3 are chosen according to the input common-mode voltage requirements of the receiver. As highlighted before, make sure that the reduced swing is able to meet the requirements of the receiver. Higher swing mode (boosted LVDS swing mode) can be selected using the AMP_SEL pin highlighted in [Table 8-3](#) to compensate for the reduced swing as the result of the resistor voltage divider.

9.2.3 Application Curves

The low additive noise of the LMK1D2108. The low noise 156.25-MHz source with 25-fs RMS jitter, shown in Figure 9-3, drives the LMK1D2108, resulting in 46.9-fs RMS when integrated from 12 kHz to 20 MHz (Figure 9-4). The resultant additive jitter is a low 39.7-fs RMS for this configuration. Note that this result applies to the LMK1D2106 device as well.

Note: Reference signal is a low-noise Rhode and Schwarz SMA100B

Figure 9-3. LMK1D2108 Reference Phase Noise, 156.25 MHz, 25-fs RMS (12 kHz to 20 MHz)

Figure 9-4. LMK1D2108 Output Phase Noise, 156.25 MHz, 46.9-fs RMS (12 kHz to 20 MHz)

10 Power Supply Recommendations

High-performance clock buffers are sensitive to noise on the power supply, which can dramatically increase the additive jitter of the buffer. Thus, it is essential to reduce noise from the system power supply, especially when jitter or phase noise is critical to applications.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the low impedance path for high-frequency noise and guard the power-supply system against the induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and must have low equivalent series resistance (ESR). To properly use the bypass capacitors, they must be placed close to the power-supply pins and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1- μ F) bypass capacitors as there are supply pins in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock driver. These ferrite beads prevent the switching noise from leaking into the board supply. Choose an appropriate ferrite bead with low DC resistance because it is imperative to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply pins that is greater than the minimum voltage required for proper operation.

Figure 10-1 shows this recommended power-supply decoupling method.

Figure 10-1. Power Supply Decoupling

11 Layout

11.1 Layout Guidelines

For reliability and performance reasons, the die temperature must be limited to a maximum of 135°C.

The device package has an exposed pad that provides the primary heat removal path to the printed circuit board (PCB). To maximize the heat dissipation from the package, a thermal landing pattern including multiple vias to a ground plane must be incorporated into the PCB within the footprint of the package. The thermal pad must be soldered down to ensure adequate heat conduction to of the package. [Figure 11-1](#) and [Figure 11-2](#) show the recommended top layer and via patterns for the 40-pin package (LMK1D2106).

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
