

16-BIT, 1.25 MSPS, PSEUDO-BIPOLAR, FULLY DIFFERENTIAL INPUT, MICRO POWER SAMPLING ANALOG-TO-DIGITAL CONVERTER WITH PARALLEL INTERFACE

FEATURES

- Pseudo-Bipolar, Fully Differential Input, $-V_{REF}$ to V_{REF}
- 16-Bit NMC at 1.25 MSPS
- ± 2 LSB INL Max, $-1/+1.25$ LSB DNL
- 90 dB SNR, -95 dB THD at 100 kHz Input
- Zero Latency
- Internal 4.096 V Reference
- High-Speed Parallel Interface
- Single 5 V Analog Supply
- Wide I/O Supply: 2.7 V to 5.25 V
- Low Power: 155 mW at 1.25 MHz Typ
- Pin Compatible With ADS8412/8402
- 48-Pin TQFP Package

APPLICATIONS

- DWDM
- Instrumentation
- High-Speed, High-Resolution, Zero Latency Data Acquisition Systems
- Transducer Interface
- Medical Instruments
- Communications

DESCRIPTION

The ADS8406 is a 16-bit, 1.25 MHz A/D converter with an internal 4.096-V reference. The device includes a 16-bit capacitor-based SAR A/D converter with inherent sample and hold. The ADS8406 offers a full 16-bit interface and an 8-bit option where data is read using two 8-bit read cycles.

The ADS8406 has a pseudo-bipolar, fully differential input. It is available in a 48-lead TQFP package and is characterized over the industrial -40°C to 85°C temperature range.

High Speed SAR Converter Family

Type/Speed	500 kHz	580 kHz	750 MHz	1.25 MHz	2 MHz	3 MHz	4 MHz
18 Bit Pseudo-Diff	ADS8383	ADS8381					
16 Bit Pseudo-Diff			ADS8371	ADS8401	ADS8411		
				ADS8405			
16 Bit Pseudo Bipolar, Fully Differential				ADS8402	ADS8412		
				ADS8406			
14 Bit Pseudo-Diff				ADS7890 (S)		ADS7891	
12 Bit Pseudo-Diff							ADS7881

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ORDERING INFORMATION⁽¹⁾

APPLICATION INFORMATION

MICROCONTROLLER INTERFACING

ADS8406 to 8-Bit Microcontroller Interface

Figure 31 shows a parallel interface between the ADS8406 and a typical microcontroller using the 8-bit data bus. The BUSY signal is used as a falling-edge interrupt to the microcontroller.

Figure 31. ADS8406 Application Circuitry (using external reference)

Figure 32. Use Internal Reference

PRINCIPLES OF OPERATION

The ADS8406 is a high-speed successive approximation register (SAR) analog-to-digital converter (ADC). The architecture is based on charge redistribution, which inherently includes a sample/hold function. See Figure 31 for the application circuit for the ADS8406.

The conversion clock is generated internally. The conversion time of 650 ns is capable of sustaining a 1.25-MHz throughput.

PRINCIPLES OF OPERATION (continued)

DIGITAL INTERFACE

Timing And Control

See the timing diagrams in the specifications section for detailed information on timing signals and their requirements.

The ADS8406 uses an internal oscillator generated clock which controls the conversion rate and in turn the throughput of the converter. No external clock input is required.

Conversions are initiated by bringing the $\overline{\text{CONVST}}$ pin low for a minimum of 20 ns (after the 20 ns minimum requirement has been met, the $\overline{\text{CONVST}}$ pin can be brought high), while $\overline{\text{CS}}$ is low. The ADS8406 switches from the sample to the hold mode on the falling edge of the $\overline{\text{CONVST}}$ command. A clean and low jitter falling edge of this signal is important to the performance of the converter. The BUSY output is brought high after $\overline{\text{CONVST}}$ goes low. BUSY stays high throughout the conversion process and returns low when the conversion has ended.

Sampling starts as soon as the conversion is over when $\overline{\text{CS}}$ is tied low or starts with the falling edge of $\overline{\text{CS}}$ when BUSY is low.

Both $\overline{\text{RD}}$ and $\overline{\text{CS}}$ can be high during and before a conversion with one exception ($\overline{\text{CS}}$ must be low when $\overline{\text{CONVST}}$ goes low to initiate a conversion). Both the $\overline{\text{RD}}$ and $\overline{\text{CS}}$ pins are brought low in order to enable the parallel output bus with the conversion.

Reading Data

The ADS8406 outputs full parallel data in two's complement format as shown in Table 1. The parallel output is active when $\overline{\text{CS}}$ and $\overline{\text{RD}}$ are both low. There is a minimal quiet zone requirement around the falling edge of $\overline{\text{CONVST}}$. This is 50 ns prior to the falling edge of $\overline{\text{CONVST}}$ and 40 ns after the falling edge. No data read should be attempted within this zone. Any other combination of $\overline{\text{CS}}$ and $\overline{\text{RD}}$ sets the parallel output to 3-state. BYTE is used for multiword read operations. BYTE is used whenever lower bits of the converter result are output on the higher byte of the bus. Refer to Table 1 for ideal output codes.

Table 1. Ideal Input Voltages and Output Codes

DESCRIPTION	ANALOG VALUE	DIGITAL OUTPUT	
		2'S COMPLEMENT	
Full scale range	$2(+V_{\text{ref}})$		
Least significant bit (LSB)	$2(+V_{\text{ref}})/65536$	BINARY CODE	HEX CODE
+Full scale	$(+V_{\text{ref}}) - 1 \text{ LSB}$	0111 1111 1111 1111	7FFF
Midscale	0 V	0000 0000 0000 0000	0000
Midscale – 1 LSB	0 V – 1 LSB	1111 1111 1111 1111	FFFF
– Full scale	$(-V_{\text{ref}})$	1000 0000 0000 0000	8000

The output data is a full 16-bit word (D15–D0) on DB15–DB0 pins (MSB–LSB) if BYTE is low.

The result may also be read on an 8-bit bus for convenience. This is done by using only pins DB15–DB8. In this case two reads are necessary: the first as before, leaving BYTE low and reading the 8 most significant bits on pins DB15–DB8, then bringing BYTE high. When BYTE is high, the low bits (D7–D0) appear on pins DB15–D8.

These multiword read operations can be done with multiple active $\overline{\text{RD}}$ (toggling) or with $\overline{\text{RD}}$ tied low for simplicity.

Conversion Data Readout

BYTE	DATA READ OUT	
	DB15–DB8 Pins	DB7–DB0 Pins
High	D7–D0	All one's
Low	D15–D8	D7–D0

RESET

$\overline{\text{RESET}}$ is an asynchronous active low input signal (that works independently of $\overline{\text{CS}}$). Minimum $\overline{\text{RESET}}$ low time is 25 ns. Current conversion will be aborted no later than 50 ns after the converter is in the reset mode. In addition, all output latches are cleared (set to zero's) after $\overline{\text{RESET}}$. The converter goes back to normal operation mode no later than 20 ns after $\overline{\text{RESET}}$ input is brought high.

The converter starts the first sampling period 20 ns after the rising edge of $\overline{\text{RESET}}$. Any sampling period except for the one immediately after a $\overline{\text{RESET}}$ is started with the falling edge of the previous BUSY signal or the falling edge of CS, whichever is later.

Another way to reset the device is through the use of the combination of $\overline{\text{CS}}$ and $\overline{\text{CONVST}}$. This is useful when the dedicated $\overline{\text{RESET}}$ pin is tied to the system reset but there is a need to abort only the conversion in a specific converter. Since the BUSY signal is held high during the conversion, either one of these conditions triggers an internal self-clear reset to the converter just the same as a reset via the dedicated $\overline{\text{RESET}}$ pin. The reset does not have to be cleared as for the dedicated $\overline{\text{RESET}}$ pin. A reset can be started with either of the two following steps.

- Issue a $\overline{\text{CONVST}}$ when $\overline{\text{CS}}$ is low and a conversion is in progress. The falling edge of $\overline{\text{CONVST}}$ must satisfy the timing as specified by the timing parameter $t_{\text{su(AB)}}$ mentioned in the timing characteristics table to ensure a reset. The falling edge of $\overline{\text{CONVST}}$ starts a reset. Timing is the same as a reset using the dedicated $\overline{\text{RESET}}$ pin except the instance of the falling edge is replaced by the falling edge of $\overline{\text{CONVST}}$.
- Issue a $\overline{\text{CS}}$ while a conversion is in progress. The falling edge of $\overline{\text{CS}}$ must satisfy the timing as specified by the timing parameter $t_{\text{su(AB)}}$ mentioned in the timing characteristics table to ensure a reset. The falling edge of $\overline{\text{CS}}$ causes a reset. Timing is the same as a reset using the dedicated $\overline{\text{RESET}}$ pin except the instance of the falling edge is replaced by the falling edge of $\overline{\text{CS}}$.

POWER-ON INITIALIZATION

RESET is not required after power on. An internal power-on-reset circuit generates the reset. To ensure that all of the registers are cleared, the three conversion cycles must be given to the converter after power on.

LAYOUT

For optimum performance, care should be taken with the physical layout of the ADS8406 circuitry.

As the ADS8406 offers single-supply operation, it is often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to achieve good performance from the converter.

The basic SAR architecture is sensitive to glitches or sudden changes on the power supply, reference, ground connections and digital inputs that occur just prior to latching the output of the analog comparator. Thus, driving any single conversion for an n-bit SAR converter, there are at least n *windows* in which large external transient voltages can affect the conversion result. Such glitches might originate from switching power supplies, nearby digital logic, or high power devices.

The degree of error in the digital output depends on the reference voltage, layout, and the exact timing of the external event.

On average, the ADS8406 draws very little current from an external reference, as the reference voltage is internally buffered. If the reference voltage is external and originates from an op amp, make sure that it can drive the bypass capacitor or capacitors without oscillation. A 0.1- μF bypass capacitor and a 1- μF storage capacitor are recommended from pin 1 (REFIN) directly to pin 48 (REFM). REFM and AGND should be shorted on the same ground plane under the device.

The AGND and BDGND pins should be connected to a clean ground point. In all cases, this should be the analog ground. Avoid connections which are close to the grounding point of a microcontroller or digital signal processor. If required, run a ground trace directly from the converter to the power supply entry point. The ideal layout consists of an analog ground plane dedicated to the converter and associated analog circuitry.

As with the AGND connections, +VA should be connected to a 5-V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. Power to the ADS8406 should be clean and well bypassed. A 0.1- μ F ceramic bypass capacitor should be placed as close to the device as possible. See Table 2 for the placement of the capacitor. In addition, a 1- μ F to 10- μ F capacitor is recommended. In some situations, additional bypassing may be required, such as a 100- μ F electrolytic capacitor or even a Pi filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5-V supply, removing the high frequency noise.

Table 2. Power Supply Decoupling Capacitor Placement

POWER SUPPLY PLANE SUPPLY PINS	CONVERTER ANALOG SIDE	CONVERTER DIGITAL SIDE
Pin pairs that require shortest path to decoupling capacitors	(4,5), (8,9), (10,11), (13,15), (43,44), (45,46)	(24,25), (34, 35)
Pins that require no decoupling	12, 14	37

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK

PFB (S-PQFP-G48)

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
