# 32-Bit Traveo™ Family S6J3110 Series Microcontroller Datasheet

The S6J3110 series is a set of 32-bit microcontrollers designed for in-vehicle use. It uses the ARM® Cortex-R5 CPU as a CPU.

## Features

This section explains the features of the S6J3110 series.

### Cortex-R5 Core

This section explains the Cortex-R5 CPU core.

- ARM® Cortex®-R5
- 32-bit ARM architecture
  - 2-instruction issuance super scalar
  - 8-stage pipeline
- ARMv7/Thumb®-2 instruction set
- MPU (memory protection) equipped
  - 16-area support
- ECC support for the TCM ports for RAM
  - 1-bit error correction and 2-bit error detection (SEC-DED)
- TCM ports
  - 2 TCM ports
    - ATCM port
    - BTCM port (BOTCM, B1TCM)
- Caches
  - Instruction cache 16 KB
  - Data cache 16 KB
- VIC port
  - Low latency interrupt
- AXI master interface
  - 64-bit AXI interface (instruction/data access)
  - 32-bit AXI interface (I/O access)
- AXI slave interface
  - 64-bit AXI interface (TCM port access)
- ETM-R5 trace

### Peripheral Functions

This section explains peripheral functions.

- Clock generation
  - Main clock oscillation (4 MHz)
  - No sub clock oscillation
  - CR oscillation (100 kHz)
  - CR oscillation (4 MHz)
- Built-in flash memory size
  - Program: 4096 K + 64 KB (S6J311EyzC\*) / 3072K + 64KB (S6J311DyzC\*) / 2048K + 64KB (S6J311CyzC\*) / 1536K + 64KB (S6J311ByzC\*)

- Work: 112 KB (S6J311EyzC\*) / 112 KB (S6J311DyzC\*) / 112 KB (S6J311CyzC\*) / 112 KB (S6J311ByzC\*)

\* y: J/H, z: A/B

- Built-in RAM size
  - TCRAM 64 KB
  - System SRAM 256 KB (S6J311EyzC\*) / 192KB (S6J311DyzC\*) / 128KB (S6J311CyzC\*) / 64KB (S6J311ByzC\*)
  - Backup RAM 64 KB (S6J311EyzC\*) / 64 KB (S6J311DyzC\*) / 64 KB (S6J311CyzC\*) / 64 KB (S6J311ByzC\*)
- \* y: J/H, z: A/B
- General-purpose ports: 150 channels (S6J311xJzC\*)/116 channels (S6J311xHzC\*)
  - \* x: E/D/C/B, z: A/B
- DMA controller
  - Up to 16 channels can be activated simultaneously.
- A/D converter (successive approximation type)
  - 12-bit resolution, 2 units mounted: Max 64 channels (32 channels + 32 channels)
- External interrupt input: 16 channels
  - Level ("H"/"L") and edge (rising/falling) can be detected.
- Multi-function serial (transmission and reception FIFOs mounted): Max 22 channels
  - <I<sup>2</sup>C>
    - Full-duplex double buffering system, 64-byte transmission FIFO, 64-byte reception FIFO.
    - Standard mode ( Max. 100kbps ) is supported only.
    - DMA transfer is supported (only for ch.0 to ch.7).
  - <UART (asynchronous serial interface)>
    - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
    - Parity check can be enabled/disabled.
    - Built-in dedicated baud rate generator
    - An external clock can be used as a transfer clock.
    - Parity, frame, overrun error detection functions are available.
    - DMA transfer is supported (only for ch.0 to 7).
  - <CSIO (synchronous serial interface)>
    - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
    - Support for SPI. Both master and slave roles are supported. Data length in bits can be set to a value from 5 to 16 or one of the values of 20, 24, and 32.
    - Built-in dedicated baud rate generator (master operation)
    - External clock input is enabled (slave operation).

- Overrun error detection function is available.
- DMA transfer is supported (only for ch.0 to ch.7).
- Serial chip select SPI function
  - <LIN-UART (asynchronous serial interface for LIN)>
- Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
- Support for LIN protocol revision 2.1
- Both master and slave roles are supported.
- Framing error and overrun error detection
- LIN Synch break generation and detection, LIN Synch Delimiter generation
- Built-in dedicated baud rate generator
- The external clock can be adjusted by the reload counter.
- DMA transfer is supported (only for ch.0 to ch.7).
- CAN controller: CAN-FD Max 2 channel
  - CAN-FD (V3.2.0)
  - CAN transfer speed: 1Mbps
  - CAN Clock: Max 40MHz
  - 192 message buffers/channel (reception message buffer size)
  - 32 message buffer/channel (transmission message buffer size)
- Base timer: MAX 30 channels
  - 16-bit Timer.
  - It is selectable by 4 functions of the PWM/PPG/PWC/Reload Timer.
  - 2-channel cascade connection enables operation as a 32-bit timer.(PWC and Reload Timer)
- Free-run timer: Max 6 channels
  - 32-bit Timer.
  - Main clock oscillation and CR oscillation are available.
  - Free-run timer output can work in combination with an input capture and an output compare.
- Input capture: Max 12 channels
  - 32-bit Timer.
- Output compare: Max 12 channels
  - 32-bit Timer.
- Real time clock (RTC) (day/hour/minute/second)
  - Main clock oscillation or CR oscillation (100 kHz) can be selected as an operation clock.
- Calibration: Real time clock (RTC) driven by the CR clock
- Correction can be done by configuring the prescaler of the real time clock based on the ratio between the main clock and the CR clock.
- Clock supervisor
  - Abnormality (such as damaged crystal) of the main clock oscillation (4 MHz) can be monitored.
  - The clock can switch to the CR clock when an abnormality is detected.
  - PLL abnormality can be detected.
- CRC generation
  - Fixed-length CRC
  - CCITT CRC16 generator polynomial: 0x1021
  - IEEE-802.3 CRC32 generator polynomial: 0x04C11DB7
- Watchdog timer
  - Hardware watchdog
  - Software watchdog
- NMI
- I/O relocation
  - Peripheral function pin locations can be changed.
- Low-power consumption control
  - Standby function
  - Power-off function
  - Partial wakeup function
- Power-on reset
- Low-voltage detection reset
- Security
  - Flash security
  - Interface security (JTAG + test port)
  - SHE
  - Unique device ID
- Package:
  - LEP176 (S6J311xJzC\*) \* x: E/D/C/B, z: A/B
  - LES144 (S6J311xHzC\*) \* x: E/D/C/B, z: A/B
- CMOS 55 nm technology
- Power supply
  - 5 V single power supply
  - The voltage step-down circuit generates internal 1.2 V from 5 V.
  - 5 V power supply is used for I/O.

## **5. Handling Precautions**

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

### **5.1 Precautions for Product Design**

This section describes precautions when designing electronic equipment using semiconductor devices.

#### **Absolute Maximum Ratings**

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### **Recommended Operating Conditions**

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### **Processing and Protection of Pins**

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

##### **(1) Preventing Over-Voltage and Over-Current Conditions**

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

##### **(2) Protection of Output Pins**

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

##### **(3) Handling of Unused Input Pins**

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

### Latch-Up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

### Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

### Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

### Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

### 5.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress recommended conditions. For detailed information about mount conditions, contact your sales representative.

#### Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

#### Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

#### Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

#### Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product.  
Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5 °C and 30 °C.  
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

#### Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 °C/24 h

#### Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%.  
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).  
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 5.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

**CAUTION:** Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

## 6. Handling Devices

### For Latch-Up Prevention

The latch-up phenomenon may occur on a CMOS IC in the following cases: the voltage applied to an input or output pin is higher than VCC or lower than VSS; or the voltage applied between a VCC pin and a VSS pin exceeds the rating. A latch-up causes a rapid increase in the power supply current, possibly resulting in thermal damage to an element. When using the device, take sufficient care not to exceed the maximum rating.

Also be careful that analog power supplies (AVCC0, AVCC1, AVRH0, and AVRH1) and analog inputs do not exceed the digital power supply (VCC) at the analog system power-on and power-off times.

The power-on sequence is as follows. Simultaneously turn on the digital supply voltage (VCC) and analog supply voltages (AVCC0, AVCC1, AVRH0, and AVRH1), or turn on the digital supply voltage (VCC) and then the analog supply voltages (AVCC0, AVCC1, AVRH0, and AVRH1).

### About Handling Unused Pins

Leaving unused input pins open may cause permanent damage from a malfunction or latch-up. Take measures for unused pins, such as pulling up or pulling down the voltage with resistors of 2 kilohms or higher.

If there are any unused input/output pins, set them to the output state and then open them, or set them to the input state and handle them in the same way as input pins.

### About Power Supply Pins

If the device has multiple VCC and VSS pins, the device is designed in such a way that the pins that should be at the same potential are connected to each other inside the device to prevent malfunctions such as latch-up. However, to reduce unwanted emissions, prevent malfunctions of strobe signals caused by an increase of the ground level, and observe standards on total output current, be sure to connect all the VCC and VSS pins to the power source and ground externally. Also handle all the VSS power supply pins in this way as shown in the following diagram. If there are multiple VCC or VSS systems, the device does not operate normally even within the guaranteed operating range.

**Figure 6-1 Pin Assignment**

In addition, consider connecting with low impedance from the power supply source to the VCC and VSS of this device.

In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between the VCC pin and the VSS pin

**About the Crystal Oscillation Circuit**

Noise entering the X0 or X1 pin may cause a malfunction. Design the printed circuit board in such a way that the X0 and X1 pins, the crystal oscillator (or ceramic resonator), and a bypass capacitor to ground are located very close to the device.

We recommend that the printed circuit board artwork have the X0 and X1 pins enclosed by ground.

**About the Mode Pin (MD)**

Use mode pin MD by directly connecting it to a VCC or VSS pin. To prevent noise from causing the device to accidentally enter test mode, reduce the pattern length between each mode pin and a VCC or VSS pin on the printed circuit board, and connect them with low impedance.

**About the Power-on Time**

To prevent a malfunction of the voltage step-down circuit built in the device, the voltage rising must be monotonic during power-on.

**Point to Note during PLL Clock Operation**

While a PLL clock is selected, if the oscillator breaks off or input stops, the PLL clock may continue operating with the free running frequency of the internal self-oscillator circuit. This operation is outside of the guaranteed range.

### Power Supply Pin Processing of an A/D Converter

Even when no A/D converter is used, establish a connection such that  $AV_{CC}=AVRH=V_{CC}$  and  $AV_{SS}/AVRL=V_{SS}$ .

### Points to Note About Using External Clocks

External clocks are not supported.

External direct clock input cannot be used.

### Power-on Sequence of the Power Supply Analog Inputs of an A/D Converter

Be sure to turn on the digital power supply ( $V_{CC}$ ) before the application of the power supplies ( $AV_{CC}$ ,  $AVRH$ , and  $AVRL$ ) and analog inputs ( $AN0$  to  $AN63$ ) of an A/D converter.

At the power-off time, turn off the power supplies and analog inputs of the A/D converter, and then turn off the digital power supply ( $V_{CC}$ ). Perform these power-on and power-off operations without  $AVRH$  exceeding  $AV_{CC}$ . Even when using a pin shared with an analog input as an input port, do not allow the input voltage to exceed  $AV_{CC}$ . (Turning on or off the analog supply voltage and digital supply voltage simultaneously is not a problem.)

### About C Pin Processing

This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (pin 154 in S6J311xJzC specifications, pin 126 in S6J311xHzC specifications) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet.

### Precautions on Designing a Mounting Substrate

Measures against heat generation from the package must be taken for the mounting substrate to observe the absolute maximum rating (operating temperature). Design a mounting substrate with 4 or more layers. Connect the back of the package stage and the substrate pad with solder paste. Arrange thermal via holes on the substrate pad. For detailed information about mount conditions, contact your sales representative.

### Notes on Writing to a Register Containing a Status Flag

In writing to a register containing a status flag (particularly an interrupt request flag, etc.) to control a function, it is important to take care not to accidentally clear the status flag.

Therefore, before the write operation, configure the status bit such that the flag is not cleared, and then set the control bit to the desired value.

Especially for control bits configured as a set of multiple bits, bit instructions cannot be used (bit instructions have only 1-bit access). In such cases, byte, half-word, or word access is used to write to the control bits and a status flag simultaneously. However, at this time, be careful not to accidentally clear bits other than the intended ones (the status flag bit in this case).

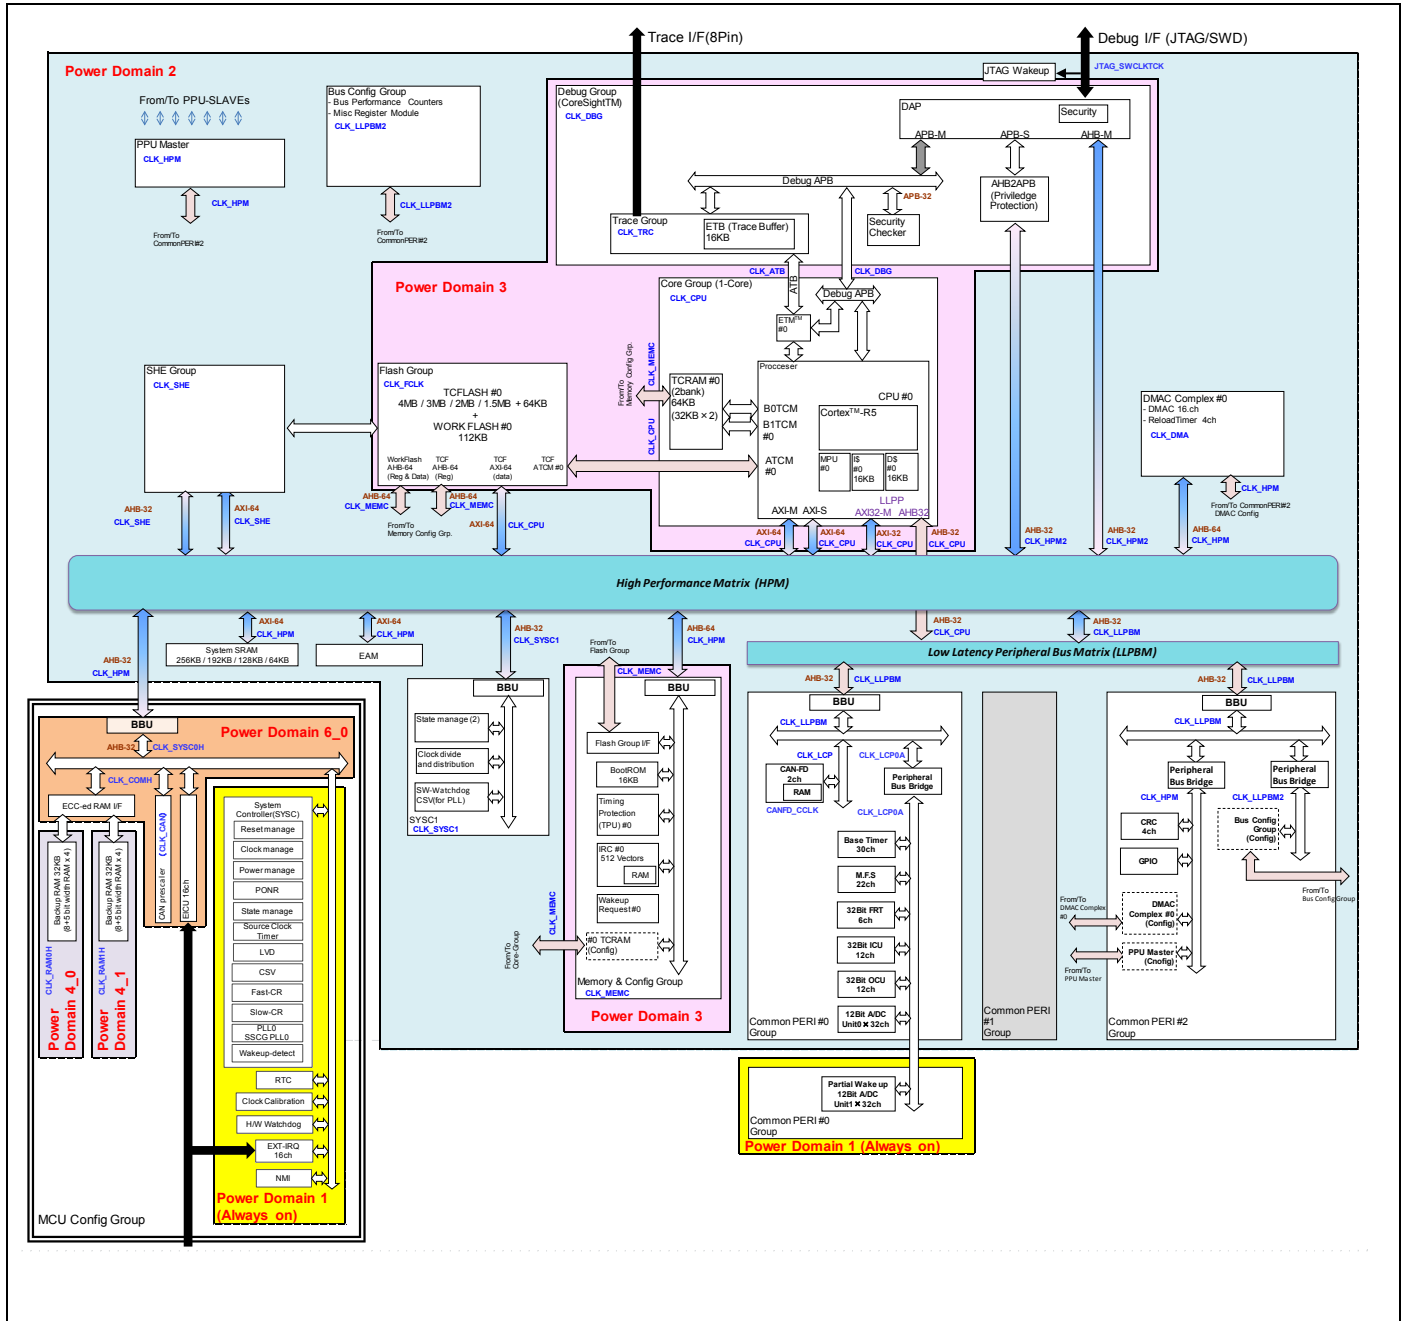

Note: Bit instructions take this point into account for registers that support bit-band units, so it does not need to be a concern. You need to take care when using bit instructions for registers that do not support bit-band units.

  3. WORKFLASH (0x0E00\_0000 -), WORKFLASH (0x0E20\_0000 -), and WORKFLASH (0x0E30\_0000 -)

The ECC movement in TCM port is based on ECC setting inside the CPU.

- The differences between the TCM FLASH and AXI FLASH include the following.

Function	TCM FLASH	AXI FLASH
High-speed Access Using Dedicated Bus	Applicable	Not applicable
Write and Erase	Not applicable (Read-only)	Applicable
Read	Applicable	Applicable

- The differences between WORKFLASH areas include the following.

Area	Function
WORKFLASH Area 1	Used in write operation (with ECC)
WORKFLASH Area 3	Used in write operation (without ECC)
WORKFLASH Area 4	Used in read operation

□ Terms are as follows.

<b>Term</b>	<b>Description</b>
TCM RAM	Main RAM
TCM FLASH	Program FLASH (TCM area)
AXI FLASH	Program FLASH (AXI area) This is physically the same as the TCM FLASH.
SYSTEM RAM	System RAM
AXI SLAVE CORE	AXI CPU control area
WORKFLASH	FLASH for work
BACKUP RAM	Backup RAM
Peri area	Entire area for peripheral functions
APPS#5	Part of area for peripheral functions
ERRCFG	Error configuration area
BootROM	ROM for reset boot

When MPU attribute of Cortex-R5 is configured as "Normal", store buffer inside Cortex-R5 can operate and write data can be merged. To avoid influence of this data merger, MPU attribute "Device" or "Strongly Ordered" should be used.

MPU attribute "Device" or "Strongly Ordered" must be used for areas below, to avoid this influence.

- Backup RAM area (BACKUP\_RAM) [0E80\_0000 ~ 0E87\_FFFF]
- Peripheral area (Peri area) [B000\_0000 ~ B7FF\_FFFF]
- Error Config area (ERRCFG) [FFFE\_E000 ~ FFFE\_FFFF]

MPU attribute "Device" or "Strongly Ordered" is required for accesses to areas below, in particular situation.

- FLASH Memory (when writing commands)

SHE OFF product is prohibited to access SHE area (B200\_0000 to B20F\_FFFF)

\*1: Input disable is not valid when external interrupts are enabled.

\*2: Recovery from standby (power off) becomes a factor.

\*3: The pin state from the time that HOLDIO\_PD2 was set (SYSC\_SSPECFGR.HOLDIO\_PD2=1) is retained. If power-off has not occurred and HOLDIO\_PD2 has not been set (SYSC\_SSPECFGR.HOLDIO\_PD2=0), the last state is retained.

\*4: To power off power domains 2 and 3, be sure to set HOLDIO\_PD2 (SYSC\_SSPECFGR.HOLDIO\_PD2=1).

\*5: When the PWU function is enabled, a change to output occurs.

\*6: The pin state when the PORT function is enabled is shown.

\*7: When PPC\_PCFGrijj.POF[2:0] is set to initial value.

\*1: These parameters are based on the condition that V<sub>SS</sub>=AV<sub>SS</sub>=0.0V.

\*2: AV<sub>CC</sub> and V<sub>CC</sub> must be set to the same voltage. It is required that AV<sub>CC</sub> does not exceed V<sub>CC</sub> and that the voltage at the analog inputs does not exceed AV<sub>CC</sub> when the power is switched on.

\*3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

\*4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current X the operation ratio.

\*5: The total output current is defined as the maximum current value flowing through all of corresponding pins.

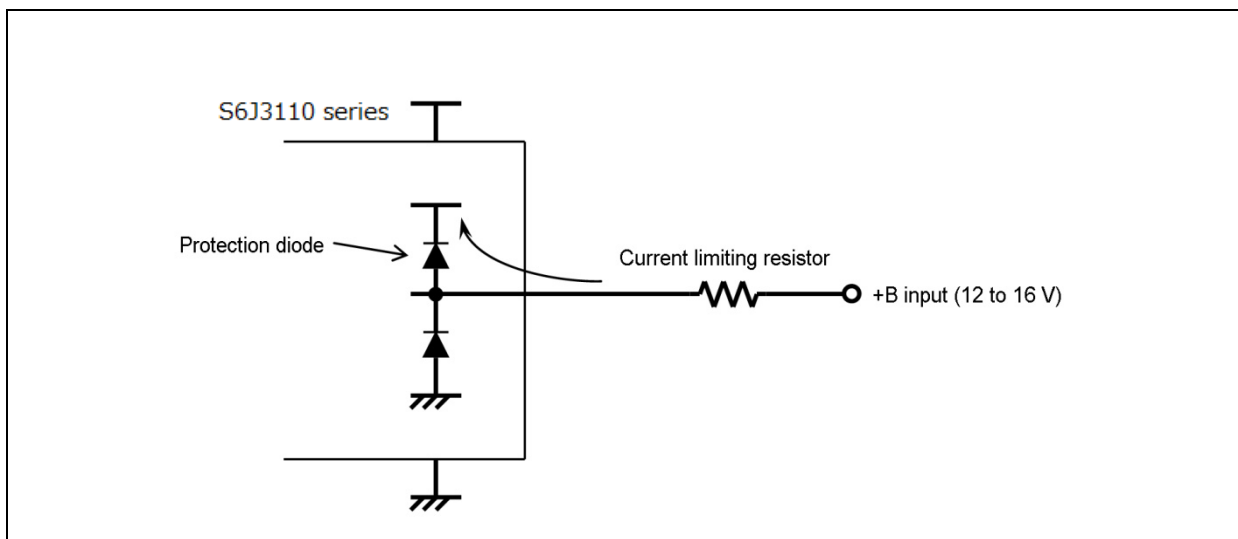

\*6: Corresponding pins: general-purpose ports

\*7: Corresponding pins: All general-purpose ports and analog input pins

- Use the device within the recommended operating conditions.
- Use the device with direct voltage (current).
- The + B signal should always be applied by connecting a limiting resistor between the + B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the + B signal is input.
- Note that when the microcontroller drive current is low, such as in the low-power consumption modes, the + B input potential can increase the potential at the VCC pin via a protective diode, possibly affecting other devices.
- Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave + B input pins open.

\*8: It is standard when four-layer substrate is used.

Example of a recommended circuit

**WARNING:**

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

**WARNING:**

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

**Notes:**

- The following condition should be satisfied in order to facilitate heat dissipation.
  1. 4 or more layers PCB should be used.
  2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard)
  3. 1 layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90% or more. The layer can be used for system ground.
  4. 35~50% of the die stage area which is exposed at back surface of package should be soldered to a part of 1<sup>st</sup> layer.
  5. The part of 1<sup>st</sup> layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.

**Figure 10.2-1: Example thermal via holes on PCB.**

**Notes:**

- Figure 10.2-1 is a schematic diagram showing PCB in section.
- Figure 10.2-2, Figure 10.2-3 in the following pages are recommended land patterns for each package series. Thermal via holes should closely be placed and aligned with lands.
- If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Relationship between the oscillation clock frequency and internal clock frequency

Oscillation Clock Frequency	Main Clock	PLL Multiplier Setting	PLL Output Division Setting	PLL Clock
4 MHz	4 MHz	144	4	144 MHz
4 MHz	4 MHz	144	6	96 MHz

Oscillation circuit example

Note:

- When configuring the oscillator circuit, it is recommended to ask matching evaluation of the circuit to oscillator manufacturers for the design.
  - The maximum PLL clock frequency must be 144MHz.
- Output division configuration can be set by the following.
- PLLDIVM bit in SYSC0\_RUNPLL0CNTR register
  - PLLDIVM bit in SYSC0\_PSSPLL0CNTR register
  - SSCGDIVM bit in SYSC0\_RUNSSCG0CNTR0 register
  - SSCGDIVM bit in SYSC0\_PSSSSCG0CNTR0 register
- (e.g. If PLLout is 576MHz, these settings must be configured as "multiply by 4" and over multiplication setting)

AC characteristics are specified by the following measurement reference voltage values

**10.4.3 Reset Input**

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Level detection voltage	-	VCC	-	2.15	2.35	2.55	V	
Level release voltage	-	VCC	-	2.25	2.45	2.65	V	
Level detection hysteresis width	-	VCC	-	-	100	-	mV	
Level detection time	-	-	-	-	-	30	μs	*1
Power off time	t <sub>OFF</sub>	VCC	-	1	-	-	ms	*2
Power ramp rate	dV/dt	V <sub>CC</sub>	VCC: 0.2V to 2.55V	-	-	6	mV/μs	*3
Maximum ramp rate guaranteed to not generate power-on reset	dV/dt	V <sub>CC</sub>	VCC: Between 2.6V and 4.5V	-	-	50	mV/μs	*4

\*1: The specified level detection time applies only for power ramp rate of 6mV/μs or less.

\*2: V<sub>CC</sub> must be held below 0.2V for a minimum period of t<sub>OFF</sub>.

\*3: Power-on can detect by satisfying power ramp rate when power off time is not satisfied.

\*4: This specification is specified the power supply fluctuation after power on detection. When VCC voltage is between 2.6V and 4.5V, the power supply fluctuation is below 50mV/us, the detection of power-on is suppressed. The power-on does not detect in any power fluctuation between 4.5V and 5.5V.

### Note:

When neither \*2 nor \*3 can be satisfied, use S6J311xHzC\* and assert external reset (RSTX) at power-up and at any brownout event.

\* x: E/D/C/B, z: A/B

### • Power off time, Power ramp rate at Power-on

### • Maximum ramp rate guaranteed to not generate power-on reset

### 10.11.2 Notes on Using A/D Converter

#### About the Output Impedance of an External Circuit for Analog Input

When the external impedance is too high, the analog voltage sampling time may become insufficient. In this case, we recommend attaching a capacitor (about 0.1  $\mu$ F) to an analog input pin.

**10.11.3 Definition of Terms**

Resolution: Analog variation that is recognized by an A/D converter

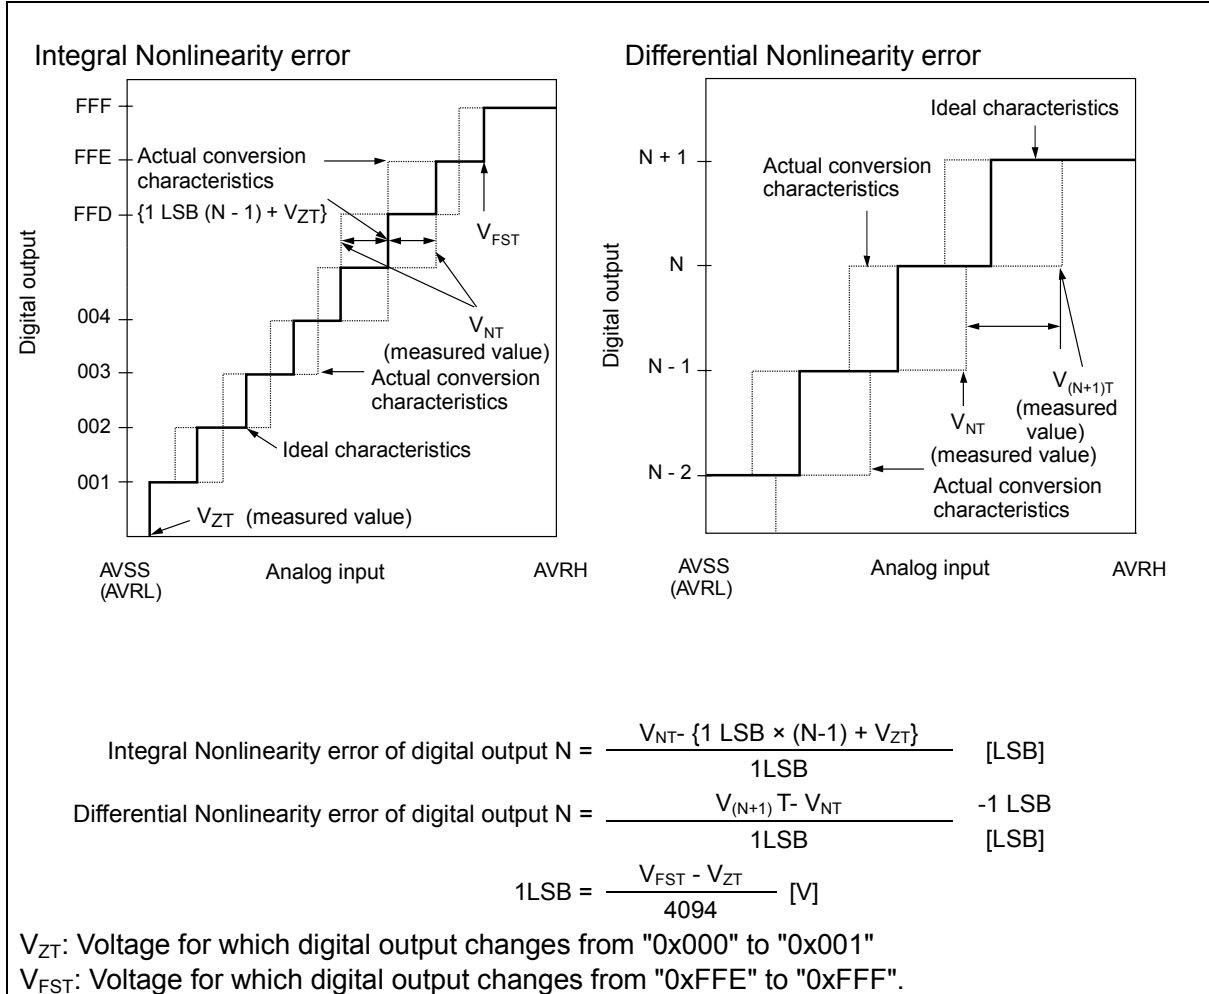

Integral Nonlinearity error <sup>\*1</sup>: Deviation of the straight line connecting the zero transition point ("0000 0000 0000" <--> "0000 0000 0001") and full-scale transition point ("1111 1111 1110" <--> "1111 1111 1111") from actual conversion characteristics includes zero transition error, full-scale transition error, and non-linearity error.

Differential Nonlinearity error: Deviation from the ideal value of the input voltage required for changing the output code by 1 LSB

Total error: Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and non linearity error.

\*1: Represented as "Linearity error" in the former product series.

\*1: Guaranteed value for up to 100,000 erases

\*2: Number of erases for each sector

### Notes:

- While the Flash memory is written or erased, shutdown of the external power (V<sub>CC</sub>) is prohibited.
- In the application system where V<sub>CC</sub> might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function.
- To put it concretely, after the external power supply voltage falls below the detection voltage (V<sub>DL</sub>), hold V<sub>CC</sub> at 2.7V or more within the duration calculated by the following expression:

$$Td^{*1} [\mu s] + ( 1 / F_{CRF}^{*2} [MHz] ) \times 1029 + 25 [\mu s]$$

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS ( mm)
- △ DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
- △ DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
- △ TO BE DETERMINED AT SEATING PLANE C.
- △ DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
- △ DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
- △ REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS, DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS, BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
- △ DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. THE DAMBAR PROTRUSION ( S ) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
- △ EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
- △ THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
- △ A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

## 14. Major Changes

Revision *A		
1	Cover	Added the family product names
1	Cover	Revised the designation and notes
1	Cover	Revised the title as follow (error) S6J3110 Series 32-bit Microcontroller Spansion® Traveo™ Family (correct) S6J311E, S6J311D, S6J311C, S6J311B 32-Bit Traveo™ Family S6J3110 Series Microcontroller Datasheet
1	Features Cortex-R5 Core	Revised the following note (Error) -ECC support for the TCM ports (Correct) -ECC support for the TCM ports for RAM
1	Features Peripheral Functions	Added the specifications as full production
1	Features Peripheral Functions	Added I <sup>2</sup> C function of MFS
1,2	Features Peripheral Functions	Added SHE option to the product name
2	Features Peripheral Functions	Added the following comment to 192 message buffer for CAN-FD “(reception message buffer size)”
2	Features Peripheral Functions CAN controller: CAN-FD Max 2 channel	Added -32 message buffer/channel (transmission message buffer size)
2	Features Peripheral Functions	Added “CAN-FD (V3.2.0)” under “CAN controller: CAN-FD Max 2 channel”.
4	1. Product Lineup	Added the specifications as full production
4,5	1. Product Lineup	Added SHE option to lineup (Table 1-1, 1-2, 1-3)
6,7	2. Pin Assignment	Added SHE option to the product name
7	2. Pin Assignment	Added the pin assignment figure for S6J311xHAC
7	2. Pin Assignment	Revised the pin function name of 107pin to P321/PWUTRG
8,20	3. Pin Description	Added SHE option to the product name
8 - 27	3. Pin Description	Separated non-analog input IO type from Type A/B to Type P/Q
8-27	3. Pin Description	Added I <sup>2</sup> C bus pins
25	3. Pin Description	Added the pin name PWUTRG to 107pin Revised the IO Circuit Type of 107pin
28	4. I/O Circuit Types	Revised the circuit of type C
30	4. I/O Circuit Types	Added the IO Circuit Type R
37	6. Handling Devices About power supply pins	The explanation should be corrected as indicated by the shading below. (Error) We recommend connecting a ceramic capacitor as a bypass capacitor between VCC and VSS, near this device. (Correct) In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between the VCC pin and the VSS pin.

Page	Section	Change Results
37	6.Handling Devices	Revised the following notice. (Error) About the Power-on Time To prevent the internal built-in voltage step-down circuit from malfunctioning, secure a voltage rising time of 50 μs (between 0.2 V and 2.7 V) or longer at the power-on time. (Correct) About the Power-on Time To prevent a malfunction of the voltage step-down circuit built in the device, the voltage rising must be monotonic during power-on.
38	6.Handling Devices About C pin processing	The pins should be deleted as indicated by the shading below. (Error) This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (pin 46 and pin 154 in S6J311xJAA specifications, pin 38 and pin 126 in S6J311xHAA specifications) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet. (Correct) This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (pin 154 in S6J311xJzC specifications, pin 126 in S6J311xHzC specifications) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet.
39, 40	7. Block Diagram	Added SHE option to the product name
39, 40	7. Block Diagram	Revised the block diagram of S6J311xJAC and S6J311xHAC
40	7. Block Diagram	Added Partial Wake up in the diagram of Power Domain 1(Always on)
41	8. Memory Map	Revised the memory map of S6J311ExAC / S6J311DxAC / S6J311CxAC / S6J311BxAC
41,44,46,47, 49	8. Memory Map	Added SHE option to the product name
42	8. Memory Map	Added the following notes The ECC movement in TCM port is based on ECC setting inside the CPU.
44 - 49	8. Memory Map	Revised the peripheral map of S6J311xJAC and S6J311xHAC
46,49	8. Memory Map	Added Global Timer to Table 8-2 and Table 8-4
49	8. Memory Map	Added about the setting of MPU attribute for memory area
49	8. Memory Map	Added the the following restriction about SHE OFF product
50,52	9. Pin Statuses In CPU Status	Added SHE option to the product name
50 - 53	9. Pin Statuses In CPU Status	Revised the pin status table of S6J311xJAC and S6J311xHAC
50 - 53	9. Pin Statuses In CPU Status	Corrected the state name from "Watch mode" to "Timer mode"
51	9. Pin Statuses In CPU Status	Revised the Pin name of 130pin as follows (Error) P320/PWUTRG/WOT (Correct) P320/PWUTRG
53	9. Pin Statuses In CPU Status	Revised the pin status table for P321
53	9. Pin Statuses In CPU Status	Added the pin name PWUTRG to 107pin
54	9. Pin Statuses In CPU Status	Added the following note *7: When PPC_PCFGrijj:POF[2:0] is set to initial value.

58,59	10. Electrical Characteristics 10.2 Recommended operating conditions	Added the following figures  Figure 10.2-1: Example thermal via holes on PCB. Figure 10.2-2: Land Pattern and Thermal Via LEP176 Figure 10.2-3: Land Pattern and Thermal Via LES144
60	10. Electrical Characteristics 10.3 DC characteristics	Revised the minimum value of $V_{IH6}$ 2.0 -> 2.3
64	10. Electrical Characteristics 10.4.1 Source clock timing	Added the following characteristics - PLL input clock frequency ( $F_{PLLI}$ ) - PLL macro oscillation clock frequency ( $F_{PLLO}$ ) - SSCG-PLL input clock frequency ( $F_{SSCGPLLI}$ ) - SSCG-PLL macro oscillation clock frequency ( $F_{SSCGPLLO}$ )
66, 67	10. Electrical Characteristics 10.4.2 Internal clock timing	Added the following characteristics - $F_{CLK\_CANFD}$ , $t_{CLK\_CANFD}$ (CANFD_CCLK)
67	10. Electrical Characteristics 10.4.2 Internal Clock Timing	Revised the following Symbol. (Error) $t_{CLK\_FMA}$ (Correct) $t_{CLK\_DMA}$
67	10. Electrical Characteristics 10.4.2 Internal Clock Timing	Revised the following Values (Error) $t_{CLK\_LAPP1}$ min:41.6 / $t_{CLK\_LAPP1A}$ min:41.6 (Correct) $t_{CLK\_LAPP1}$ min:27.7 / $t_{CLK\_LAPP1A}$ min:27.7
68	10. Electrical Characteristics 10.4.2 Internal clock timing	Rivised the internal clock definition in the following figure. "Guaranteed operation range Internal operation clock frequency vs. Power supply voltage" $F_{CD0\_CLK}$ -> $F_{CPU\_CLK}$
69	10. Electrical Characteristics 10.4.2 Internal clock timing	Added the note of maximum PLL clock frequency setting "PLLDIVM" and "SSCGDIVM"
70	10. Electrical Characteristics 10.4.2 Internal clock timing	Revised the voltage value of Hysteresis input pin (TTL). 2.0V -> 2.3V
72	10. Electrical Characteristics 10.4.4 Power-on conditions	Revised the note"*1" for "Level detection time"
72	10. Electrical Characteristics 10.4.4 Power-on Conditions	Revised the value of level detection voltage (Error) min 2.25 / typ 2.45 / max 2.65 (Correct) min 2.15 / typ 2.35 / max 2.55
72	10. Electrical Characteristics 10.4.4 Power-on Conditions	Deleted the Slope detection undetected specification. Added the Power ramp rate and Maximum ramp rate guaranteed to not generate power-on reset. *1, *2: Changed the sentence. Added *3, *4, Note, Figure at the Power off time, Power ramp rate, Maximum ramp rate guaranteed to not generate power-on reset.
87	10. Electrical Characteristics 10.4.5 Multi-function serial 10.4.5.1 CSIO timing (SMR:MD2-0=010B) (5-1-7) Serial chip select used (SCSCR:CSEN=1)	Added figures for the characteristic
95,96	10. Electrical Characteristics 10.4.5.4 I2C timing (SMR:MD[2:0]=100B)	Added the AC characteristic for I2C
98	10. Electrical Characteristics 10.6 Trigger input timing	Deleted the following pin names in the table of Input pulse width and figure of Trigger input timing "RX0 to RX1", "RXx"
100	10. Electrical Characteristics 10.8 Low-voltage detection(external low-voltage detection)	Revised the following characteristics $V_{DL}$ -> $V_{DL0}$ , $V_{DL1}$ , $V_{DL2}$
100	10. Electrical Characteristics 10.8 Low-voltage detection(external low-voltage detection)	Added the register setting for the following characteristics $V_{DL0}$ , $V_{DL1}$ , $V_{DL2}$
101	10. Electrical Characteristics 10.9 Low-Voltage Detection (RAM Retention Low-Voltage Detection)	Revised the title in 10.9 "Internal Low-Voltage Detection" to "RAM Retention Low-Voltage Detection".

Page	Section	Change Results
101	10. Electrical Characteristics 10.10 Low-voltage detection(1.2V power supply low-voltage detection)	Revised the following characteristics $V_{RDL} \rightarrow V_{RDL0}, V_{RDL1}$
101	10. Electrical Characteristics 10.10 Low-voltage detection(1.2V power supply low-voltage detection)	Added the register setting for the following characteristics $V_{RDL0}, V_{RDL1}$
101	10. Electrical Characteristics 10.10 Low-Voltage Detection (1.2 V Power Supply Low-Voltage Detection)	Added the notice *4
103	10.11 A/D converter 10.11.2 Notes on Using A/D converter	Revised the figure "Analog input circuit model"
104	10. Electrical Characteristics 10.11.3 Definition of terms	Revised the following notes (error) Total error : Difference between the actual value and the theoretical value. The total error (correct) Total error: Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and non linearity error.
104	10.11 A/D converter 10.11.3 Definition of terms	Revised the title as follows "12.11.3 Glossary" -> "12.11.3 Definition of terms"
104 - 105	10.11 A/D converter 10.11.3 Definition of terms	Revised the following names (meaning is same) - Integral linearity error -> Integral Nonlinearity error - Differential linearity error -> Differential Nonlinearity error
106	10.12 Flash memory	Revised the items of sector erase time and write time Filled maximum values in the Rating table
106	10.12 Flash memory	Added the notes of power management for Flash memory
107	11. Ordering Information	Revised the Part Number as full production
107	11. Ordering Information	Added SHE option to the part number
107	12. Part Number Option	Added the part number options as full production
107	12. Part Number Option	Added Part Number Option "z" as SHE option
109	13. Package Dimensions	Added the package dimension of LES144
1,2,4 to 27, 38 to41,44, 46,47,49,50, 52,57,72, 107,	-	Revised part number from S6J311xxxA to S6J311xxxC.
