## 20 W HMIC Silicon PIN Diode Terminated SPDT Switch

## Features

- Low Insertion Loss
- High Isolation
- Low Parasitic Capacitance and Inductance
- Fully Monolithic Die, Integrated Bias Network
- Glass Encapsulated Construction
- Greater than 20 W CW Power Handling @ $+85^{\circ} \mathrm{C}$
- Silicon Nitride Passivation
- Polymer Scratch Protection
- RoHS* Compliant

## Description

The MASW-010647 is a monolithic, terminated Silicon PIN diode SPDT switch designed for X-Band high power, high performance applications. The switch handles greater than 20 W of CW power over the $8.0-10.5 \mathrm{GHz}$ frequency band.

The device is fabricated using MACOM's patented HMIC process, which allows for the integration of silicon pedestals that embed series and shunt diodes in low loss, low dispersion glass. The switch offers low insertion loss of 0.8 dB as well as high isolation performance of 37 dB . The device integrates a bias network to allow for simplified bias application and switch control.

The topside is fully encapsulated with silicon nitride passivation and an additional polymer layer for scratch and impact protection. These protective coatings prevent damage to the semiconductor junctions and metal air bridges during handling and assembly.

3. R. Caverly and G. Hiller, "Establishing the Minimum Reverse Bias for a P-I-N Diode in a High Power Switch," IEEE Transactions on Microwave Theory and Techniques, Vol.38, No.12, December 1990
4. Typical switching speed measured from $10 \%$ to $90 \%$ of detected RF signal driven by TTL compatible drivers. MACOM recommends the MADR-007097, Complementary Channel TTL PIN Diode Driver.

## Bias Control ${ }^{3}$

Optimal operation is achieved by simultaneous application of negative DC voltage to the low loss switch path and positive DC voltage to the isolating switch path.

In the low loss path, the diodes are reverse biased. In the isolating path, the diodes are forward biased.

## Minimum Reverse Bias Required:

At X-Band, with a $1: 1$ match, 5 V of reverse bias is required. With a $4: 1$ match, 10 V of reverse bias is required.

However MACOM recommends 30 V of reverse bias to achieve optimal operating conditions.

5. Exceeding any one or combination of these limits may cause permanent damage to this device.
6. MACOM does not recommend sustained operation near these survivability limits.

## Handling Procedures

Please observe the following precautions to avoid damage:

## Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM class 1A devices.

## Functional Schematic

Typical Performance: $\mathrm{T}_{\mathrm{A}}=\boldsymbol{+ 2 5}{ }^{\circ} \mathrm{C}$
Insertion Loss vs. Frequency, -5V

Input Return Loss vs. Frequency
Transmission, +/-5V

Isolation vs. Frequency, +5V

Output Return Loss vs. Frequency Termination, +5V

## Typical Measured Large Signal Performance

Insertion Loss vs. Bias Voltage 9.5 GHz, 43 dBm CW

Insertion Loss vs. CW Power 9.5 GHz, -30 V
