

The S-4611A is a CMOS thermal print head driver containing a 64-bit (32-bit $\times$ 2) shift register and a 64-bit latch. It is ideal for the video printer and the low-voltage-operation thermal print head because of large driver output current and small ON-state resistance. Moreover, it is most suitable for high-speed video printer as its clock frequency is 14 MHz max. and the shift register is 32-bit $\times$ 2.

■ Features

- Low current consumption : 1.2 mA typ. ($f_{CLK} = 14$ MHz, SI : fixed)
- High speed operation : 14 MHz (chip)
- Driver output voltage : 36 V max.
- Driver output current : 70 mA max.
- 64-bit shift register and latch are built in
- Driver enable
- Driver-off function when supply voltage falls
- Selectable "H/L" for latch and driver enable

■ Block Diagram

Figure 1

■ Operation

The 64-bit shift register reads the data input to SI₁ or SI₂ on the rising edge of the CLOCK input. The data from SI₁ are read in 1-bit to 32-bit of shift register and the data from SI₂ are read in 33-bit to 64-bit.

The latch circuit operates depending on the levels of CONT and LATCH ; it reads the data of the shift register when their levels are the same, and it holds the data of the shift register when they differ.

The latch data are output to the respective drivers when $\overline{\text{AEN}}$ is low and BEN is high. The driver output transistor turns on when the latch data are high and turns off when low. Turning $\overline{\text{AEN}}$ high or BEN low makes all driver output transistors go off.

All driver output transistors go off when power supply voltage becomes lower than V_{DET} regardless of all input signals.

■ Terminal Functions (Refer to the dimensions for the pad arrangement)

Table 1

No.	Name	Functions
1 to 64	DO ₁ to DO ₆₄ (DO _n)	Driver output terminals (Nch open-drain)
65, 68, 71, 74, 77, 80, 83, 86	V _{SS1}	GND for driver (0 V)
67	V _{DD}	Positive power supply for logic (+ 5 V)
75, 81	V _{SS0}	GND for logic (0 V)
82	CLK	Clock input terminal for 64-bit shift register
85, 78	SI ₁ , SI ₂	Serial data input terminals for 32-bit × 2 shift register
79, 66	SO ₁ , SO ₂	Serial data output terminals for 32-bit × 2 shift register
84	LATCH	Data latch signal input terminal When CONT = "L" or open LATCH = "L": reads the data of the shift register LATCH = "H": holds the preceding data When CONT = "H" LATCH = "L": holds the preceding data LATCH = "H": reads the data of the shift register
76	CONT	Data latch signal control terminal : selects "H" or "L" for LATCH (pull-down resistor is built in)
73	$\overline{\text{AEN}}$	Driver enable terminal: outputs the latch data to the driver when "L" (pull-up resistor is built in)
70	BEN	Driver enable terminal: outputs the latch data to the driver when "H" (pull-down resistor is built in)
69, 72	NC	Dummy terminals

■ Absolute Maximum Ratings

Table 2

Parameter	Symbol	Ratings	Unit
Supply voltage	V _{SS0,1} - V _{DD}	-0.4 to +7.0	V
Driver output voltage	V _{DOH}	36	V
Driver output current	I _{DOL}	70	mA
Input voltage	V _{IN}	V _{SS0} -0.5 to V _{DD} + 0.5	V
Output voltage	V _{OUT}	V _{SS0} -0.5 to V _{DD} + 0.5	V
Max. junction temperature	T _{JMAX}	125	°C
Operating temperature	T _{opr}	-10 to +80	°C
Storage temperature	T _{stg}	-40 to +125	°C

■ DC Electrical Characteristics

Table 3
(Unless otherwise specified : $V_{DD} = 5.0 \text{ V} \pm 10\%$, $T_a = -10^\circ\text{C}$ to 80°C)

Parameter	Sybl	Conditions	Min.	Typ.	Max.	Unit
Supply voltage	V_{DD}		4.5	5.0	5.5	V
High level input voltage	V_{IH}		$0.8 \times V_{DD}$	—	V_{DD}	V
Low level input voltage	V_{IL}		V_{SS}	—	$0.2 \times V_{DD}$	V
High level input current	I_{IH}	$V_{DD} = 5.0 \text{ V}$ $V_{IH} = 5.0 \text{ V}$ $T_a = 25^\circ\text{C}$	—	—	35	μA
			—	—	0.5	μA
Low level input current	I_{IL}	$V_{DD} = 5.0 \text{ V}$ $V_{IL} = 0 \text{ V}$ $T_a = 25^\circ\text{C}$	—	—	—	μA
			-35	—	—	μA
High level output voltage	V_{OH}	$SO_{1,2}$ terminal, no load	4.45	—	—	V
Low level output voltage	V_{OL}	$SO_{1,2}$ terminal, no load	—	—	0.05	V
High level output current	I_{OH}	$SO_{1,2}$ terminal, $V_{OH} = V_{DD} - 0.4 \text{ V}$	—	—	-0.5	mA
Low level output current	I_{OL}	$SO_{1,2}$ terminal, $V_{OL} = 0.4 \text{ V}$	0.5	—	—	mA
High level driver output voltage	V_{DOH}		—	24	26	V
Low level driver output voltage	V_{DOL}	$I_{DOL} = 50 \text{ mA}$, $V_{DD} = 5.0 \text{ V}$	—	0.5	1.1	V
Driver leakage current	I_{LEAK}	$V_{DOH} = 26 \text{ V}$ Per 1-bit of driver output	—	—	1.0	μA
Current consumption	I_{DD}	$T_a = 25^\circ\text{C}$ $f_{CLK} = 14 \text{ MHz}$, $SI_{1,2}$: fixed	—	1.2	2.4	mA
		$f_{CLK} = 14 \text{ MHz}$, $SI = 1/2 f_{CLK}$	—	6.5	13.0	mA
Lower V_{DD} detection voltage	V_{DET}		2.0	—	4.0	V

■ AC Electrical Characteristics

Table 4
($V_{DD} = 5.0 \text{ V} \pm 10\%$, $T_a = -10^\circ\text{C}$ to 80°C)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
CLK pulse width	t_{WCLK}		30	—	—	ns
Data setup time	t_{SUD}	$V_{IH} = V_{DD}$, $V_{IL} = V_{SS0}$	30	—	—	ns
Data hold time	t_{HD}	$V_{IH} = V_{DD}$, $V_{IL} = V_{SS0}$	30	—	—	ns
Latch pulse width	t_{WLA}		50	—	—	ns
Latch setup time	t_{SULA}		50	—	—	ns
EN-DOn propagation delay time	t_{dDO}	$R_L = 1 \text{ k}\Omega$, $V_{DOH} = 24 \text{ V}$	—	—	6.5	μs
DOn rise time	t_{rDO}	$R_L = 1 \text{ k}\Omega$, $V_{DOH} = 24 \text{ V}$	—	1.7	4.5	μs
DOn fall time	t_{fDO}	$R_L = 1 \text{ k}\Omega$, $V_{DOH} = 24 \text{ V}$	—	2.0	5.0	μs
Clock frequency	f_{CLK}	Chip	—	—	14	MHz
