## LINEAR INTEGRATED CIRCUIT

### SWITCHING REGULATOR CONTROLLER(LOW VOLTAGE)

#### DESCRIPTION

The UTC **L2800** which is incorporating a soft start function and short circuit detection function is a single-channel switching regulator control IC and is made for low voltage applications. Because the device has a low minimum operating voltage of 1.8V, so it is ideal for the power supply of battery-operated electronic equipment.

#### FEATURES

- \*Wide supply voltage operating range: 1.8V~15V
- \*Low current consumption: Typically 5.5mA in operation, 1µA or less in stand-by
- \*High speed operation is possible: Maximum 1MHz
- \*The error amplifier gain is set inside the IC, so peripheral components are minimized.
- \*Incorporates a soft start circuit.
- \*Incorporates a timer-latch type short circuit detection circuit (SCP).
- \*Totem-pole type output with adjustable on/off current (for NPN transistors)
- \*Incorporates a stand-by function.

## ■ HOW TO SET THE TIME CONSTANT FOR SHORT CIRCUIT DETECTION AND SOFT START

### 1. SHORT CIRCUIT PROTECTION

The error amplifier output (FB pin) is fixed at  $V_{OM}^+$  and capacitor  $C_{PE}$  starts charging if the switching regulator output suddenly drops due to load effect. The output pin is set low and the SCP pin stays low when the voltage at the SCP pin reaches approximately 0.8V.

As the protection circuit operates, by resetting the power supply the circuit will be restored.

- Short circuit detection time

$$t_{PE}[S] \approx 0.8 \times C_{PE}[\mu F]$$

### 2. SOFT START

Once power on, the capacitor  $C_{PE}$  which is connected to the SCP pin starts charging. The soft start setting voltage is compared by the PWM comparator as the voltage's proportion at the SCP pin with the sawtooth waveform. The comparison controls the OUT pin's ON duty, which is causing the soft start operation. During the time for completion of soft start operation, the SCP pin's voltage stays low, but the soft start setting voltage stays high, and the circuit then enters the output short circuit detection wait state.

Soft start time (until the output ON duty reaches approximately 50%)

$$t_s[S] \approx 0.35 \times C_{PE}[\mu F]$$
