**1:4 ÷1/÷2 ECL/PECL Clock
Fanout Buffer**

The MC100LVEL37 is a fully differential 1:4 fanout buffer. The device offers two outputs at $\div 1$ of the input frequency, and two outputs at $\div 2$ of the input frequency. The Low Output–Output Skew of the device makes it ideal for distributing 1x and 1/2x frequency synchronous signals.

The differential inputs have special circuitry which ensures device stability under open input conditions. When both differential inputs are left open the D input will pull down to V_{EE} , The D input will bias around $V_{CC}/2$ and the Q output will go LOW.

1. Minimum input swing for which AC parameters guaranteed. The device has a DC gain of ≈ 40 .
2. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{ppmin} and 1V. The lower end of the CMR range varies 1:1 with V_{EE} . The numbers in the spec table assume a nominal $V_{EE} = -3.3V$. Note for PECL operation, the $V_{CMR(min)}$ will be fixed at $3.3V - |V_{CMR(min)}|$.
