<b>1. Features</b> .....	<b>6</b>
1.1. Special Features .....	6
1.2. System Features .....	6
1.3. CPU Features .....	6
1.4. Package Information .....	6
<b>2. General Description and Block Diagram</b> .....	<b>7</b>
<b>3. Pin Definition and Functional Description</b> .....	<b>8</b>
<b>4. Device Characteristics</b> .....	<b>13</b>
4.1. DC/AC Characteristics .....	13
4.2. Absolute Maximum Ratings.....	14
4.3. Typical IHRC Frequency vs. VDD (calibrated to 16MHz).....	15
4.4. Typical ILRC Frequency vs. VDD .....	15
4.5. Typical IHRC Frequency vs. Temperature (calibrated to 16MHz).....	16
4.6. Typical ILRC Frequency vs. Temperature .....	16
4.7. Typical Operating Current vs. VDD and CLK=IHRC/n .....	17
4.8. Typical Operating Current vs. VDD and CLK=ILRC/n.....	17
4.9. Typical IO pull high resistance.....	18
4.10. Typical IO driving current (I <sub>OH</sub> ) and sink current (I <sub>OL</sub> ) .....	18
4.11. Typical IO input high/ low threshold voltage (V <sub>IH</sub> / V <sub>IL</sub> ) .....	20
4.12. Typical power down current (I <sub>PD</sub> ) and power save current (I <sub>PS</sub> ).....	20
<b>5. Functional Description</b> .....	<b>21</b>
5.1. Program Memory – OTP .....	21
5.2. Boot Up.....	21
5.3. Data Memory – SRAM .....	22
5.4. Oscillator and clock .....	22
5.4.1. Internal High RC oscillator and Internal Low RC oscillator .....	22
5.4.2. IHRC calibration .....	22
5.4.3. IHRC Frequency Calibration and System Clock.....	23
5.4.4. System Clock and LVR levels .....	24
5.4.5. System Clock Switching.....	25
5.5. Comparator .....	26
5.5.1. Internal reference voltage (V <sub>internal R</sub> ).....	27
5.5.2. Using the comparator .....	29

5.5.3. Using the comparator and Bandgap 1.20V .....	30
5.6. 16-bit Timer (Timer16).....	31
5.7. Watchdog Timer .....	32
5.8. Interrupt.....	33
5.9. Power-Save and Power-Down .....	36
5.9.1. Power-Save mode (“stopexe”) .....	36
5.9.2. Power-Down mode (“stopsys”).....	37
5.9.3. Wake-up .....	38
5.10. IO Pins .....	38
5.11. Reset .....	39
5.12. 8-bit Timer (Timer2/Timer3) with PWM generation .....	40
5.12.1. Using the Timer2 to generate periodical waveform .....	41
5.12.2. Using the Timer2 to generate 8-bit PWM waveform.....	42
5.12.3. Using the Timer2 to generate 6-bit PWM waveform.....	44
5.13. Touch Function .....	45
<b>6. IO Registers.....</b>	<b>47</b>
6.1. ACC Status Flag Register ( <i>flag</i> ), IO address = 0x00 .....	47
6.2. Stack Pointer Register ( <i>sp</i> ), IO address = 0x02.....	47
6.3. Clock Mode Register ( <i>clkmd</i> ), IO address = 0x03.....	47
6.4. Interrupt Enable Register ( <i>inten</i> ), IO address = 0x04.....	48
6.5. Interrupt Request Register ( <i>intrq</i> ), IO address = 0x05 .....	48
6.6. Timer 16 mode Register ( <i>t16m</i> ), IO address = 0x06.....	49
6.7. MISC Register ( <i>misc</i> ), IO address = 0x08 .....	49
6.8. External Oscillator setting Register ( <i>eoscr</i> , <i>write only</i> ), IO address = 0x0a.....	49
6.9. Interrupt Edge Select Register ( <i>integs</i> ), IO address = 0x0c.....	50
6.10. Port A Digital Input Enable Register ( <i>padier</i> ), IO address = 0x0d .....	50
6.11. Port B Digital Input Enable Register ( <i>pbdir</i> ), IO address = 0x0e .....	51
6.12. Port A Data Registers ( <i>pa</i> ), IO address = 0x10 .....	51
6.13. Port A Control Registers ( <i>pac</i> ), IO address = 0x11.....	51
6.14. Port A Pull-High Registers ( <i>paph</i> ), IO address = 0x12.....	51

## 12 Touch Keys OTP Controller

---

### Revision History:

Revision	Date	Description
0.00	2020/03/25	Preliminary version

## 1. Features

### 1.1. Special Features

- ◆ Not supposed to use in AC RC step-down powered or high EFT requirement applications.  
PADAUK assumes no liability if such kind of applications can not pass the safety regulation tests.
- ◆ Operating temperature range: -20°C ~ 70°C

### 1.2. System Features

- ◆ 1.75KW OTP program memory
- ◆ 128 Bytes data RAM
- ◆ Maximum 12 IO pins can be selected as TOUCH PAD individually
- ◆ One hardware 16-bit timer
- ◆ Two hardware 8-bit timers with 6/7/8-bit PWM generation
- ◆ One hardware comparator
- ◆ 14 IO pins with optional pull-high resistor
- ◆ Bandgap circuit to provide 1.20V Bandgap voltage
- ◆ Clock sources: internal high RC oscillator and internal low RC oscillator
- ◆ Eight Levels of LVR reset: 4.0V, 3.5V, 3.0V, 2.75V, 2.5V, 2.2V, 2.0V, 1.8V
- ◆ Three selectable external interrupt pins

### 1.3. CPU Features

- ◆ Operating modes: One processing unit mode
- ◆ 82 powerful instructions
- ◆ Most instructions are 1T execution cycle
- ◆ Programmable stack pointer to provide adjustable stack level (Using 2 bytes SRAM for one stack level)
- ◆ Direct and indirect addressing modes for data and instructions
- ◆ All data memories are available for use as an index pointer
- ◆ Separated IO and memory space

### 1.4. Package Information

- ◆ PMS164-2N06: DFN (2\*2mm)
- ◆ PMS164-U06: SOT23-6 (60mil)
- ◆ PMS164-S08A: SOP8 (150mil)
- ◆ PMS164-S08B: SOP8 (150mil)
- ◆ PMS164-2N08: DFN (2\*2mm)
- ◆ PMS164-EY10B: ESSOP10 (150mil)
- ◆ PMS164-S16: SOP16 (150mil)

### 2. General Description and Block Diagram

The PMS164 is a fully static, OTP-based 8 bit CMOS MCU; it employs RISC architecture and most the instructions are executed in one cycle except that few instructions are two cycles that handle indirect memory access.

A maximum 12 keys touch controller is built inside PMS164. Besides, PMS164 also includes 1.75KW OTP program memory, 128 bytes data SRAM, one hardware 16-bit timer and two hardware 8-bit Timer2 & Timer3 with PWM generation.

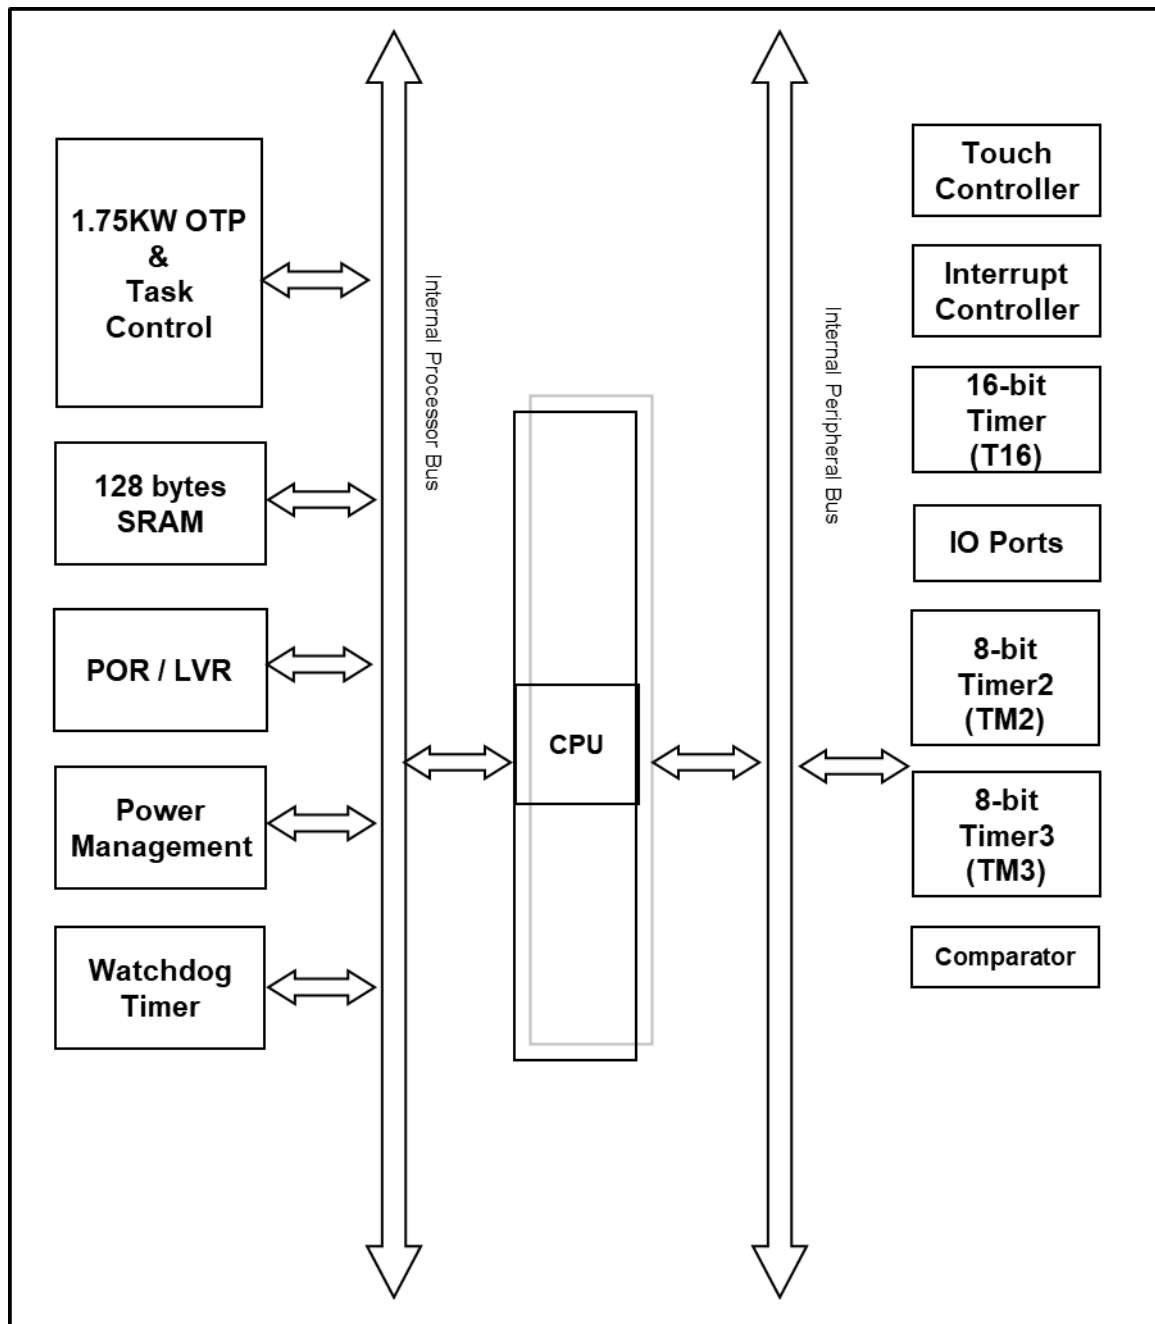

Fig. 1: PMS164 Block Diagram

### 3. Pin Definition and Functional Description

## 12 Touch Keys OTP Controller

Symbol	Description	Min.	Typ	Max.	Unit	Conditions
f <sub>IHRC</sub>	Frequency of IHRC after calibration *	15.76*	16*	16.24*	MHz	25°C, V <sub>DD</sub> =2.2V~5.5V
		15.20*	16*	16.80*		V <sub>DD</sub> =2.2V~5.5V, -20°C <Ta<70°C*
		13.60*	16*	18.40*		V <sub>DD</sub> =2.0V~5.5V, -20°C <Ta<70°C
f <sub>ILRC</sub>	Frequency of ILRC *		55		KHz	
t <sub>INT</sub>	Interrupt pulse width	30			ns	V <sub>DD</sub> = 5.0V
t <sub>WDT</sub>	Watchdog timeout period		8192		ILRC clock period	misc[1:0]=00 (default)
			16384			misc[1:0]=01
			65536			misc[1:0]=10
			262144			misc[1:0]=11
t <sub>SBP</sub>	System boot-up period from power-on		50		ms	@ V <sub>DD</sub> =5V
t <sub>RST</sub>	External reset pulse width	120			us	@ V <sub>DD</sub> =5V

\*These parameters are for design reference, not tested for every chip.

\*The characteristic diagrams are the actual measured values. Considering the influence of production drift and other factors, the data in the table are within the safety range of the actual measured values.

### 4.2. Absolute Maximum Ratings

- Supply Voltage ..... 2.0V ~ 5.5V (Maximum Rating: 5.5V)  
\*If V<sub>DD</sub> is over the maximum rating, it may lead to a permanent damage of IC.
- Input Voltage ..... -0.3V ~ V<sub>DD</sub> + 0.3V
- Operating Temperature ..... -20°C ~ 70°C
- Storage Temperature ..... -50°C ~ 125°C
- Junction Temperature ..... 150°C

### 4.3. Typical IHRC Frequency vs. VDD (calibrated to 16MHz)

### 4.4. Typical ILRC Frequency vs. VDD

### 4.5. Typical IHRC Frequency vs. Temperature (calibrated to 16MHz)

### 4.6. Typical ILRC Frequency vs. Temperature

### 4.7. Typical Operating Current vs. VDD and CLK=IHRC/n

- Conditions:
  - tog pa0(1s), **ON**: Bandgap, LVR, IHRC
  - no t16m, no interrupt, no floating IO pins, disable ILRC, **Touch**: Disable

### 4.8. Typical Operating Current vs. VDD and CLK=ILRC/n

- Conditions:
  - tog pa0(1s), **ON**: Bandgap, LVR, IHRC
  - no t16m, no interrupt, no floating IO pins, disable ILRC, **Touch**: Disable

### 4.9. Typical IO pull high resistance

### 4.10. Typical IO driving current ( $I_{OH}$ ) and sink current ( $I_{OL}$ )

### 4.11. Typical IO input high/ low threshold voltage ( $V_{IH}/ V_{IL}$ )

### 4.12. Typical power down current ( $I_{PD}$ ) and power save current ( $I_{PS}$ )

### 5. Functional Description

#### 5.1. Program Memory – OTP

The OTP (One Time Programmable) program memory is used to store the program instructions to be executed. The OTP program memory may contains the data, tables and interrupt entry. After reset, the initial address for FPP0 is 0x000. The interrupt entry is 0x010 if used. The OTP program memory for PMS164 is a 1.75KW that is partitioned as Table 1. The OTP memory from address 0x700 to 0x7FF is for system using, address space from 0x001 to 0x00F and from 0x011 to 0x6FF is user program space.

Address	Function
0x000	FPP0 reset – goto instruction
0x001	User program
•	•
•	•
0x00F	User program
0x010	Interrupt entry address
0x011	User program
•	•
0x6FF	User program
0x700	System Using
•	•
0x7FF	System Using

Table 1: Program Memory Organization

#### 5.2. Boot Up

POR (Power-On-Reset) is used to reset PMS164 when power up. The boot up time is 3000 ILRC clock cycles. Customer must ensure the stability of supply voltage after power up no matter which option is chosen, the power up sequence is shown in the Fig. 2 and  $t_{SBP}$  is the boot up time.

Please noted, during Power-On-Reset, the  $V_{DD}$  must go higher than  $V_{POR}$  to boot-up the MCU.

**Boot up from Power-On Reset**

Fig. 2: Power Up Sequence

### 5.3. Data Memory – SRAM

The access of data memory can be byte or bit operation. Besides data storage, the SRAM data memory is also served as data pointer of indirect access method and the stack memory.

The stack memory is defined in the data memory. The stack pointer is defined in the stack pointer register; the depth of stack memory of each processing unit is defined by the user. The arrangement of stack memory fully flexible and can be dynamically adjusted by the user.

For indirect memory access mechanism, the data memory is used as the data pointer to address the data byte. All the data memory could be the data pointer; it's quite flexible and useful to do the indirect memory access. All the 128 bytes data memory of PMS164 can be accessed by indirect access mechanism.

### 5.4. Oscillator and clock

There are two oscillator circuits provided by PMS164: internal high RC oscillator (IHRC) and internal low RC oscillator (ILRC), and these two oscillators are enabled or disabled by registers `clkmd.4` and `clkmd.2` independently. User can choose one of these two oscillators as system clock source and use ***clkmd*** register to target the desired frequency as system clock to meet different application.

Oscillator Module	Enable/Disable
IHRC	<b><i>clkmd.4</i></b>
ILRC	<b><i>clkmd.2</i></b>

Table 2: Oscillator Module

#### 5.4.1. Internal High RC oscillator and Internal Low RC oscillator

After boot-up, only the ILRC oscillators are enabled. The frequency of IHRC can be calibrated to eliminate process variation by ***ihrcr*** register; normally it is calibrated to 16MHz. Please refer to the measurement chart for IHRC frequency verse  $V_{DD}$  and IHRC frequency verse temperature.

The frequency of ILRC will vary by process, supply voltage and temperature, please refer to DC specification and do not use for accurate timing application.

#### 5.4.2. IHRC calibration

The IHRC frequency may be different chip by chip due to manufacturing variation, PMS164 provide the IHRC frequency calibration to eliminate this variation, and this function can be selected when compiling user's program and the command will be inserted into user's program automatically. The calibration command is shown as below:

```
.ADJUST_IC      SYSCLK=IHRC/(p1), IHRC=(p2)MHz, VDD=(p3)V
```

Where,

**p1**=2, 4, 8, 16, 32; In order to provide different system clock.

**p2**=14 ~ 18; In order to calibrate the chip to different frequency, 16MHz is the usually one.

**p3**=2.3 ~ 5.5; In order to calibrate the chip under different supply voltage.

### 5.4.3. IHRC Frequency Calibration and System Clock

During compiling the user program, the options for IHRC calibration and system clock are shown as Table 3:

SYSCLK	CLKMD	IHRCR	Description
○ Set IHRC / 2	= 34h (IHRC / 2)	Calibrated	IHRC calibrated to 16MHz, CLK=8MHz (IHRC/2)
○ Set IHRC / 4	= 14h (IHRC / 4)	Calibrated	IHRC calibrated to 16MHz, CLK=4MHz (IHRC/4)
○ Set IHRC / 8	= 3Ch (IHRC / 8)	Calibrated	IHRC calibrated to 16MHz, CLK=2MHz (IHRC/8)
○ Set IHRC / 16	= 1Ch (IHRC / 16)	Calibrated	IHRC calibrated to 16MHz, CLK=1MHz (IHRC/16)
○ Set IHRC / 32	= 7Ch (IHRC / 32)	Calibrated	IHRC calibrated to 16MHz, CLK=0.5MHz (IHRC/32)
○ Set ILRC	= E4h (ILRC / 1)	Calibrated	IHRC calibrated to 16MHz, CLK=ILRC
○ Disable	No change	No Change	IHRC not calibrated, CLK not changed

Table 3: Options for IHRC Frequency Calibration

Usually, `.ADJUST_IC` will be the first command after boot up, in order to set the target operating frequency whenever starting the system. The program code for IHRC frequency calibration is executed only one time that occurs in writing the codes into OTP memory; after then, it will not be executed again. If the different option for IHRC calibration is chosen, the system status is also different after boot. The following shows the status of PMS164 for different option:

- (1) `.ADJUST_IC`    `SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V`  
 After boot up, `CLKMD = 0x34`:
  - ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=5V and IHRC module is enabled
  - ◆ System CLK = IHRC/2 = 8MHz
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode
  
- (2) `.ADJUST_IC`    `SYSCLK=IHRC/4, IHRC=16MHz, VDD=3.3V`  
 After boot, `CLKMD = 0x14`:
  - ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=3.3V and IHRC module is enabled
  - ◆ System CLK = IHRC/4 = 4MHz
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode
  
- (3) `.ADJUST_IC`    `SYSCLK=IHRC/8, IHRC=16MHz, VDD=2.5V`  
 After boot, `CLKMD = 0x3C`:
  - ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=2.5V and IHRC module is enabled
  - ◆ System CLK = IHRC/8 = 2MHz
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode
  
- (4) `.ADJUST_IC`    `SYSCLK=IHRC/16, IHRC=16MHz, VDD=2.3V`  
 After boot, `CLKMD = 0x1C`:
  - ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=2.3V and IHRC module is enabled
  - ◆ System CLK = IHRC/16 = 1MHz
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode
  
- (5) `.ADJUST_IC`    `SYSCLK=IHRC/32, IHRC=16MHz, VDD=5V`  
 After boot, `CLKMD = 0x7C`:
  - ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=5V and IHRC module is enabled
  - ◆ System CLK = IHRC/32 = 500KHz
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is in input mode

- (6) `.ADJUST_IC`    `SYSClk=ILRC, IHRC=16MHz, VDD=5V`  
 After boot, `CLKMD = 0XE4`:
- ◆ IHRC frequency is calibrated to 16MHz@V<sub>DD</sub>=5V and IHRC module is disabled
  - ◆ System CLK = ILRC
  - ◆ Watchdog timer is disabled, ILRC is enabled, PA5 is input mode

- (7) `.ADJUST_IC`    `DISABLE`  
 After boot, `CLKMD` is not changed (Do nothing):
- ◆ IHRC is not calibrated and IHRC module is disabled
  - ◆ System CLK = ILRC
  - ◆ Watchdog timer is enabled, ILRC is enabled, PA5 is input mode

#### 5.4.4. System Clock and LVR levels

The clock source of system clock comes from IHRC or ILRC, the hardware diagram of system clock in the PMS164 is shown as Fig. 3.

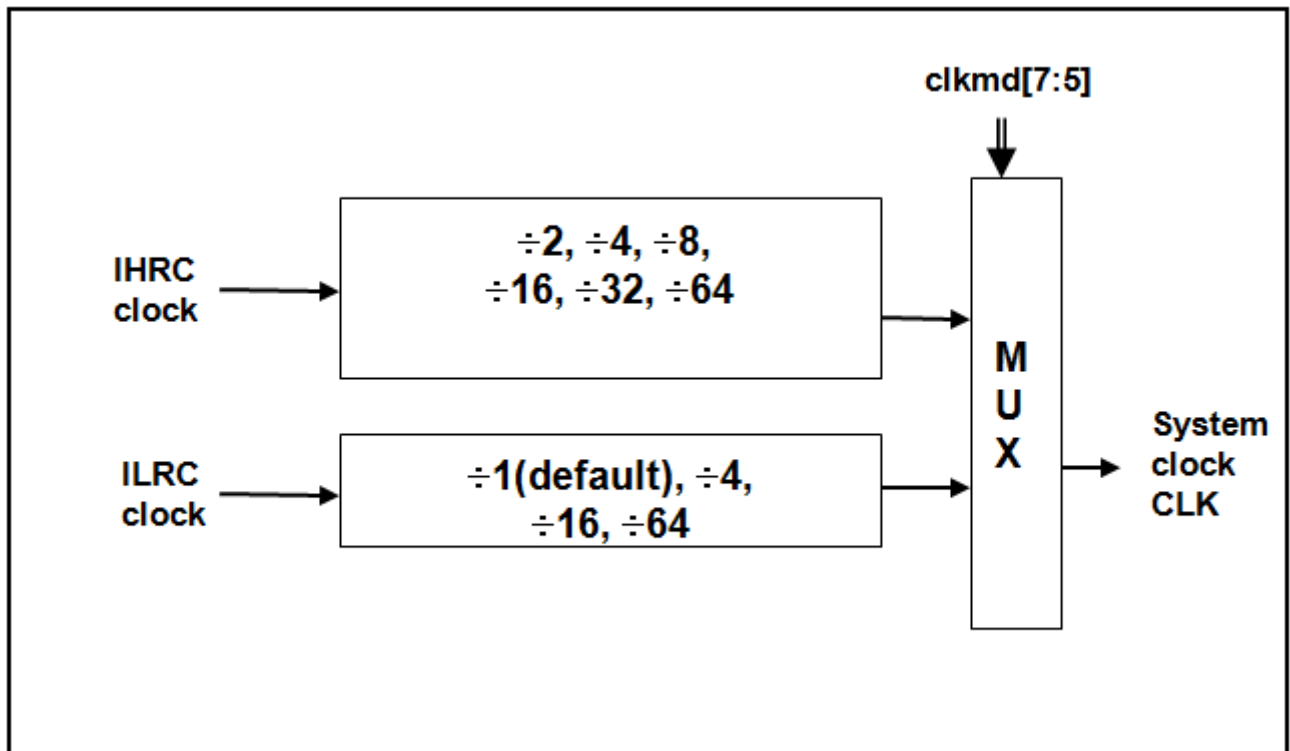

Fig. 3: Options of System Clock

User can choose different operating system clock depends on its requirement; the selected operating system clock should be combined with supply voltage and LVR level to make system stable. The LVR level will be selected during compilation, and the lowest LVR levels can be chosen for different operating frequencies. Please refer to Section 4.1.

### 5.4.5. System Clock Switching

After IHRC calibration, user may want to switch system clock to a new frequency or may switch system clock at any time to optimize the system performance and power consumption. Basically, the system clock of PMS164 can be switched among IHRC and ILRC by setting the **clkmd** register at any time; system clock will be the new one after writing to **clkmd** register immediately. Please notice that the original clock module can NOT be turned off at the same time as writing command to **clkmd** register. The examples are shown as below and more information about clock switching, please refer to the “Help” -> “Application Note” -> “IC Introduction” -> “Register Introduction” -> CLKMD”.

**Case 1:** Switching system clock from ILRC to IHRC/2

```

...                               // system clock is ILRC
CLKMD      = 0x34; // switch to IHRC/2, ILRC CAN NOT be disabled here
CLKMD.2    = 0;   // ILRC CAN be disabled at this time
...

```

**Case 2:** Switching system clock from IHRC/2 to ILRC

```

...                               // system clock is IHRC/2
CLKMD      = 0xF4; // switch to ILRC, IHRC CAN NOT be disabled here
CLKMD.4    = 0;   // IHRC CAN be disabled at this time
...

```

**Case 3:** Switching system clock from IHRC/2 to IHRC/4

```

...                               // system clock is IHRC/2, ILRC is enabled here
CLKMD      = 0X14; // switch to IHRC/4
...

```

**Case 4:** System may hang if it is to switch clock and turn off original oscillator at the same time

```

...                               // system clock is ILRC
CLKMD      = 0x30; // CAN NOT switch clock from ILRC to IHRC/2 and turn off
                               ILRC oscillator at the same time

```

### 5.5. Comparator

One hardware comparator is built inside the PMS164; Fig.4 shows its hardware diagram. It can compare signals between two pins or with either internal reference voltage  $V_{\text{internal R}}$  or internal bandgap reference voltage. The two signals to be compared, one is the plus input and the other one is the minus input. For the minus input of comparator can be PA3, PA4, Internal bandgap 1.20 volt, PB6, PB7 or  $V_{\text{internal R}}$  selected by bit [3:1] of gpcc register, and the plus input of comparator can be PA4 or  $V_{\text{internal R}}$  selected by bit 0 of gpcc register.

The comparator result can be selected through gpcc.7 to forcibly output to PB0 whatever input or output state. It can be a direct output or sampled by Timer2 clock (TM2\_CLK) which comes from Timer2 module. The output polarity can be also inverted by setting gpcc.4 register. The comparator output can be used to request interrupt service or read through gpcc.6.

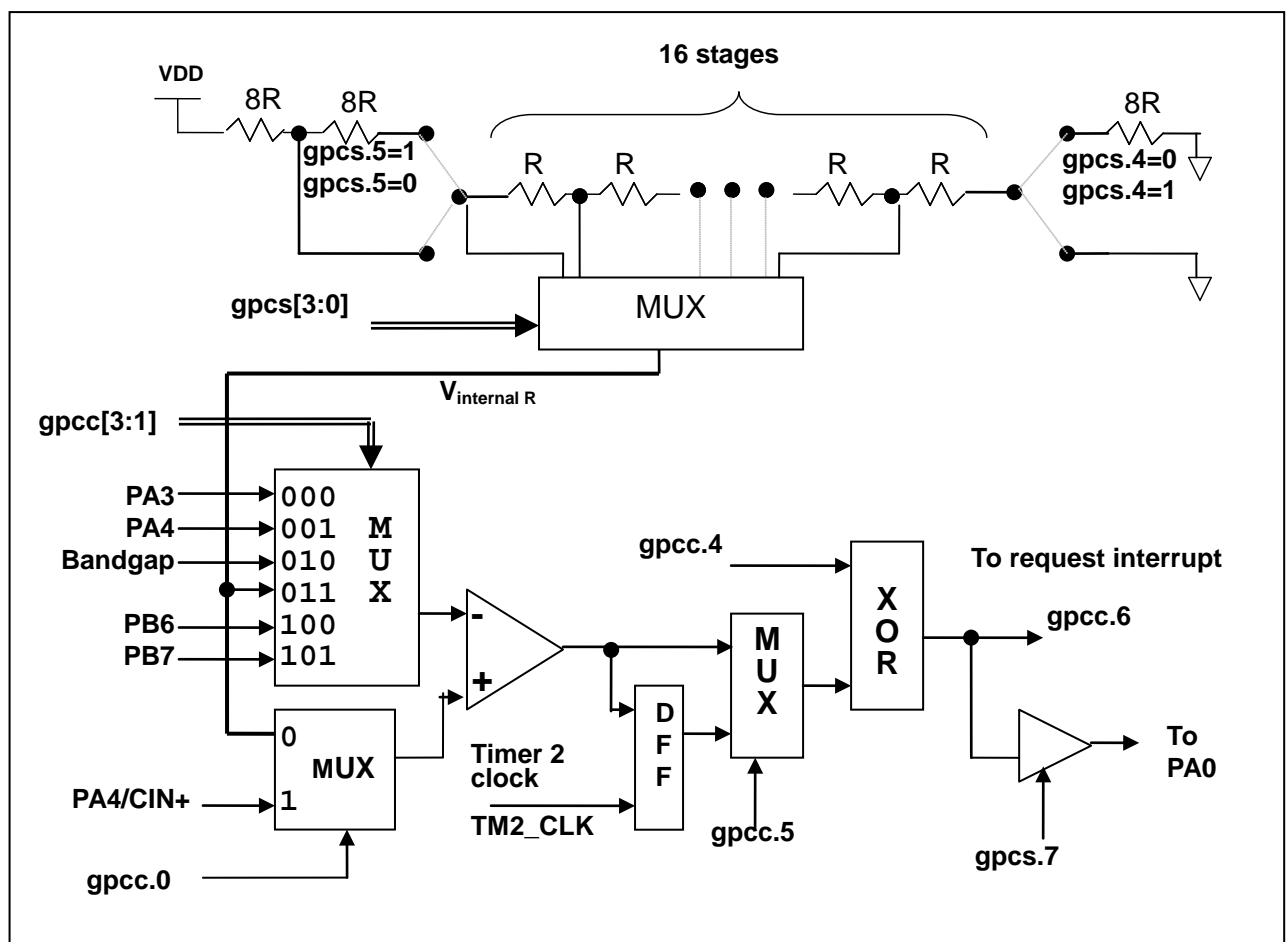

Fig.4: Hardware diagram of comparator

### 5.5.1. Internal reference voltage ( $V_{\text{internal R}}$ )

The internal reference voltage  $V_{\text{internal R}}$  is built by series resistance to provide different level of reference voltage, bit 4 and bit 5 of **gpcs** register are used to select the maximum and minimum values of  $V_{\text{internal R}}$  and bit [3:0] of **gpcs** register are used to select one of the voltage level which is divided-by-16 from the defined maximum level to minimum level. Fig.5 to Fig.8 shows four conditions to have different reference voltage  $V_{\text{internal R}}$ . By setting the **gpcs** register, the internal reference voltage  $V_{\text{internal R}}$  can be ranged from  $(1/32)*V_{\text{DD}}$  to  $(3/4)*V_{\text{DD}}$ .

Fig.5:  $V_{\text{internal R}}$  hardware connection if gpcs.5=0 and gpcs.4=0

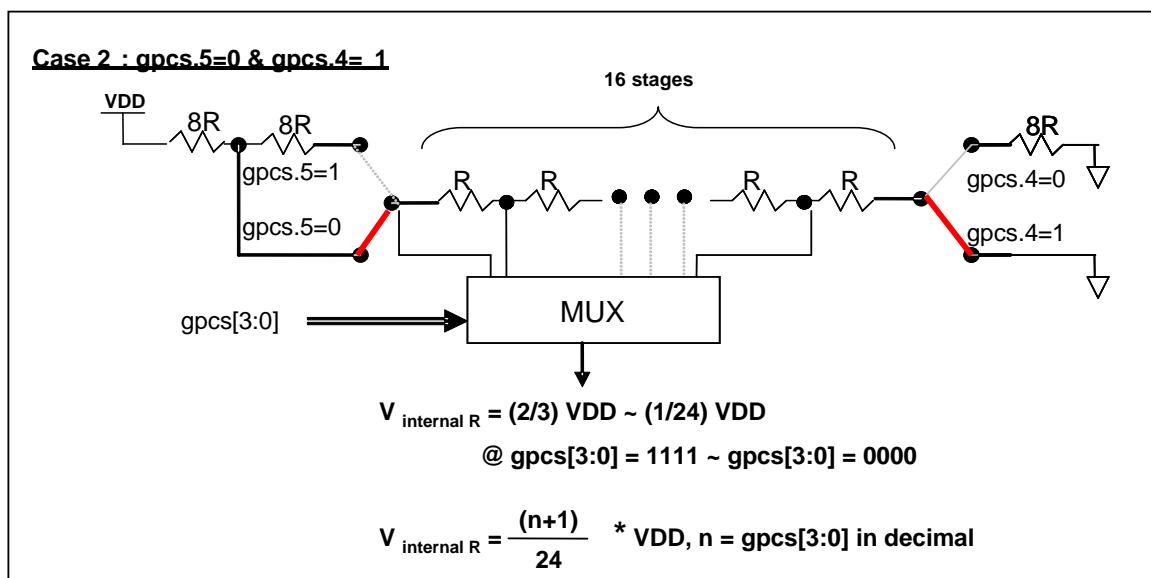

Fig.6:  $V_{\text{internal R}}$  hardware connection if gpcs.5=0 and gpcs.4=1

# PMS164

## 12 Touch Keys OTP Controller

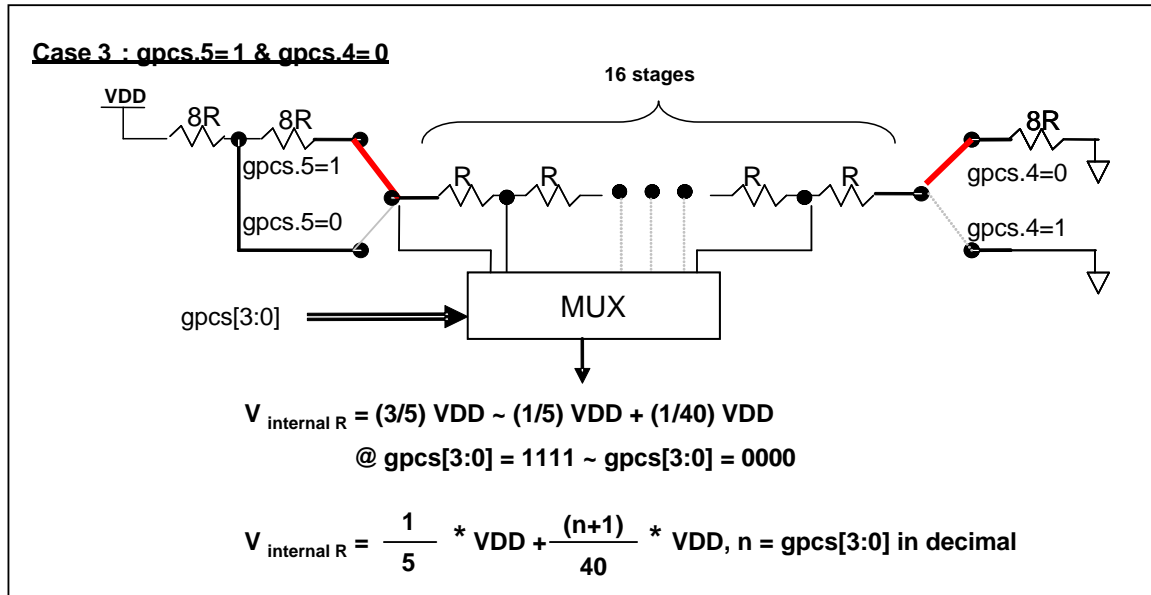

Fig.7:  $V_{\text{internal R}}$  hardware connection if gpcs.5=1 and gpcs.4=0

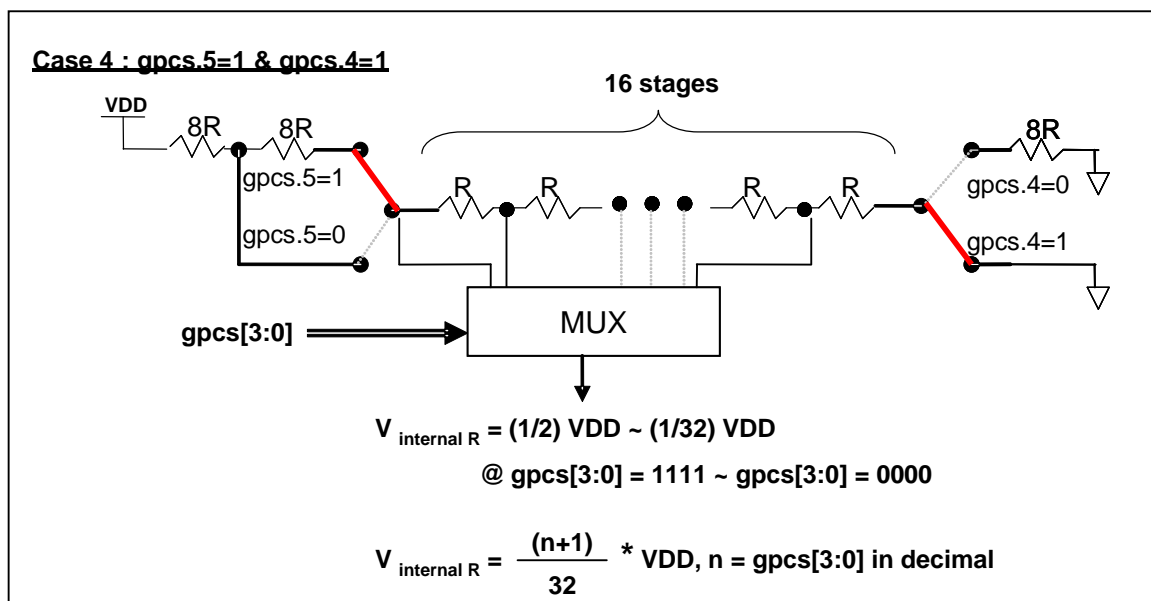

Fig.8:  $V_{\text{internal R}}$  hardware connection if gpcs.5=1 and gpcs.4=1

### 5.5.2. Using the comparator

#### Case 1:

Choosing PA3 as minus input and  $V_{internal R}$  with  $(18/32)*V_{DD}$  voltage level as plus input,  $V_{internal R}$  is configured as the above Figure “gpcs[5:4] = 2b'00” and gpcs [3:0] = 4b'1001 (n=9) to have  $V_{internal R} = (1/4)*V_{DD} + [(9+1)/32]*V_{DD} = [(9+9)/32]*V_{DD} = (18/32)*V_{DD}$ .

```

gpcs = 0b1_0_00_1001;      //  $V_{internal R} = V_{DD}*(18/32)$ 
gpcc = 0b1_0_0_0_000_0;    // enable comp, - input: PA3, + input:  $V_{internal R}$ 
padier = 0bxxxx_0_xxx;     // disable PA3 digital input to prevent leakage current

```

or

```

$ GPCS  $V_{DD}*18/32$ ;
$ GPCC Enable, N_PA3, P_R; // - input: N_xx, + input: P_R( $V_{internal R}$ )
PADIER = 0bxxxx_0_xxx;

```

#### Case 2:

Choosing  $V_{internal R}$  as minus input with  $(22/40)*V_{DD}$  voltage level and PA4 as plus input, the comparator result will be inverted and then output to PA0.  $V_{internal R}$  is configured as the above Figure “gpcs[5:4] = 2b'10” and gpcs [3:0] = 4b'1101 (n=13) to have  $V_{internal R} = (1/5)*V_{DD} + [(13+1)/40]*V_{DD} = [(13+9)/40]*V_{DD} = (22/40)*V_{DD}$ .

```

gpcs = 0b1_0_1_0_1101;    // output to PA0,  $V_{internal R} = V_{DD}*(22/40)$ 
gpcc = 0b1_0_0_1_011_1;   // Inverse output, - input:  $V_{internal R}$ , + input: PA4
padier = 0bxxx_0_xxxx;    // disable PA4 digital input to prevent leakage current

```

or

```

$ GPCS Output,  $V_{DD}*22/40$ ;
$ GPCC Enable, Inverse, N_R, P_PA4; // - input: N_R( $V_{internal R}$ ), + input: P_xx
PADIER = 0bxxx_0_xxxx;

```

Note: When selecting output to PA0 output, GPCS will affect the PA3 output function in ICE. Though the IC is fine, be careful to avoid this error during emulation.

### 5.5.3. Using the comparator and Bandgap 1.20V

The internal bandgap module can provide 1.20 volt, it can measure the external supply voltage level. The bandgap 1.20 volt is selected as minus input of comparator and  $V_{\text{internal R}}$  is selected as plus input, the supply voltage of  $V_{\text{internal R}}$  is  $V_{\text{DD}}$ , the  $V_{\text{DD}}$  voltage level can be detected by adjusting the voltage level of  $V_{\text{internal R}}$  to compare with bandgap. If N (gpcs[3:0] in decimal) is the number to let  $V_{\text{internal R}}$  closest to bandgap 1.20 volt, the supply voltage  $V_{\text{DD}}$  can be calculated by using the following equations:

For using Case 1:  $V_{\text{DD}} = [ 32 / (N+9) ] * 1.20 \text{ volt ;}$   
 For using Case 2:  $V_{\text{DD}} = [ 24 / (N+1) ] * 1.20 \text{ volt ;}$   
 For using Case 3:  $V_{\text{DD}} = [ 40 / (N+9) ] * 1.20 \text{ volt ;}$   
 For using Case 4:  $V_{\text{DD}} = [ 32 / (N+1) ] * 1.20 \text{ volt ;}$

More information and sample code, please refer to IDE utility.

Case 1:

```

$ GPCS   $V_{\text{DD}} * 12 / 40;$            // 4.0V * 12/40 = 1.2V
$ GPCC  Enable, BANDGAP, P_R;    // - input: BANDGAP, + input: P_R( $V_{\text{internal R}}$ )
....
if  (GPC_Out)                    // or GPCC.6
{                                       // when  $V_{\text{DD}} > 4V$ 
}
else
{                                       // when  $V_{\text{DD}} < 4V$ 
}

```

### 5.6. 16-bit Timer (Timer16)

PMS164 provide a 16-bit hardware timer (Timer16) and its clock source may come from system clock (CLK), internal high RC oscillator (IHRC), internal low RC oscillator (ILRC), PA0 or PA4. Before sending clock to the 16-bit counter, a pre-scaling logic with divided-by-1, 4, 16 or 64 is selectable for wide range counting. The 16-bit counter performs up-counting operation only, the counter initial values can be stored from data memory by issuing the **stt16** instruction and the counting values can be loaded to data memory by issuing the **ldt16** instruction. The interrupt request from Timer16 will be triggered by the selected bit which comes from bit[15:8] of this 16-bit counter, rising edge or falling edge can be optional chosen by register **intgs.4**. The hardware diagram of Timer16 is shown as Fig. 9.

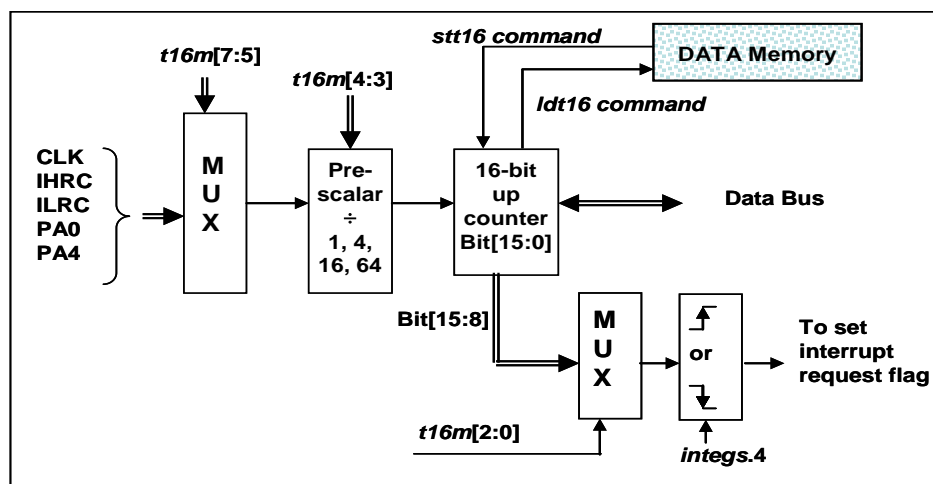

Fig. 9: Hardware diagram of Timer16

When using the Timer16, the syntax for Timer16 has been defined in the .INC file. There are three parameters to define the Timer16 using; 1<sup>st</sup> parameter is used to define the clock source of Timer16, 2<sup>nd</sup> parameter is used to define the pre-scalar and the 3<sup>rd</sup> one is to define the interrupt source.

```

T16M IO_RW 0x06
$ 7~5: STOP, SYSCLK, X, PA4_F, IHRC, X, ILRC, PA0_F // 1st par.
$ 4~3: /1, /4, /16, /64 // 2nd par.
$ 2~0: BIT8, BIT9, BIT10, BIT11, BIT12, BIT13, BIT14, BIT15 // 3rd par.

```

User can choose the proper parameters of T16M to meet system requirement, examples as below:

```

$ T16M SYSCLK, /64, BIT15;
// choose (SYSCLK/64) as clock source, every 2^16 clock to set INTRQ.2=1
// if system clock SYSCLK = IHRC / 2 = 8 MHz
// SYSCLK/64 = 8 MHz/64 = 8 uS, about every 524 mS to generate INTRQ.2=1

$ T16M PA0, /1, BIT8;
// choose PA0 as clock source, every 2^9 to generate INTRQ.2=1
// receiving every 512 times PA0 to generate INTRQ.2=1

$ T16M STOP;
// stop Timer16 counting

```

### 5.7. Watchdog Timer

The watchdog timer (WDT) is a counter with clock coming from ILRC. There are four different timeout periods of watchdog timer can be chosen by setting the *misc* register, it is:

- ◆ 8k ILRC clocks period if register *misc*[1:0]=00 (default)
- ◆ 16k ILRC clocks period if register *misc*[1:0]=01
- ◆ 64k ILRC clocks period if register *misc*[1:0]=10
- ◆ 256k ILRC clocks period if register *misc*[1:0]=11

The frequency of ILRC may drift a lot due to the variation of manufacture, supply voltage and temperature; user should reserve guard band for safe operation. Besides, the watchdog period will also be shorter than expected after Reset or Wakeup events. It is suggested to clear WDT by *wdreset* command after these events to ensure enough clock periods before WDT timeout.

When WDT is timeout, PMS164 will be reset to restart the program execution. The relative timing diagram of watchdog timer is shown as Fig.10.

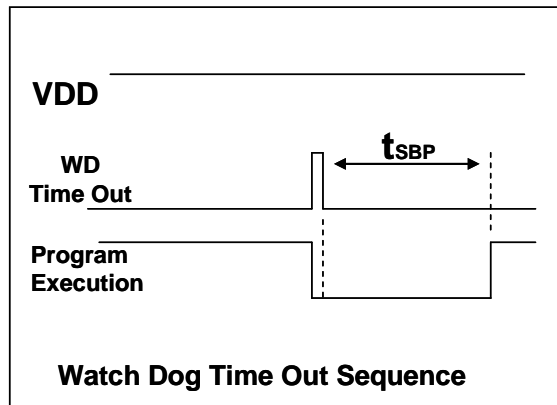

Fig. 10: Sequence of Watch Dog Time Out

### 5.8. Interrupt

There are eight interrupt lines for PMS164:

- ◆ External interrupt PA0 / PA5
- ◆ External interrupt PB0
- ◆ Timer16 interrupt
- ◆ Timer2 interrupt
- ◆ Timer3 interrupt
- ◆ GPC interrupt
- ◆ Two touch key interrupts (TK\_OV and TK\_END)

Every interrupt request line has its own corresponding interrupt control bit to enable or disable it; the hardware diagram of interrupt function is shown as Fig. 11. All the interrupt request flags are set by hardware and cleared by writing *intrq* register. When the request flags are set, it can be rising edge, falling edge or both, depending on the setting of register *integs*. All the interrupt request lines are also controlled by *engint* instruction (enable global interrupt) to enable interrupt operation and *disgint* instruction (disable global interrupt) to disable it. The stack memory for interrupt is shared with data memory and its address is specified by stack register *sp*. Since the program counter is 16 bits width, the bit 0 of stack register *sp* should be kept 0. Moreover, user can use *pushaf* / *popaf* instructions to store or restore the values of *ACC* and *flag* register *to* / *from* stack memory.

Since the stack memory is shared with data memory, user should manipulate the memory using carefully. By adjusting the memory location of stack point, the depth of stack pointer could be fully specified by user to achieve maximum flexibility of system.

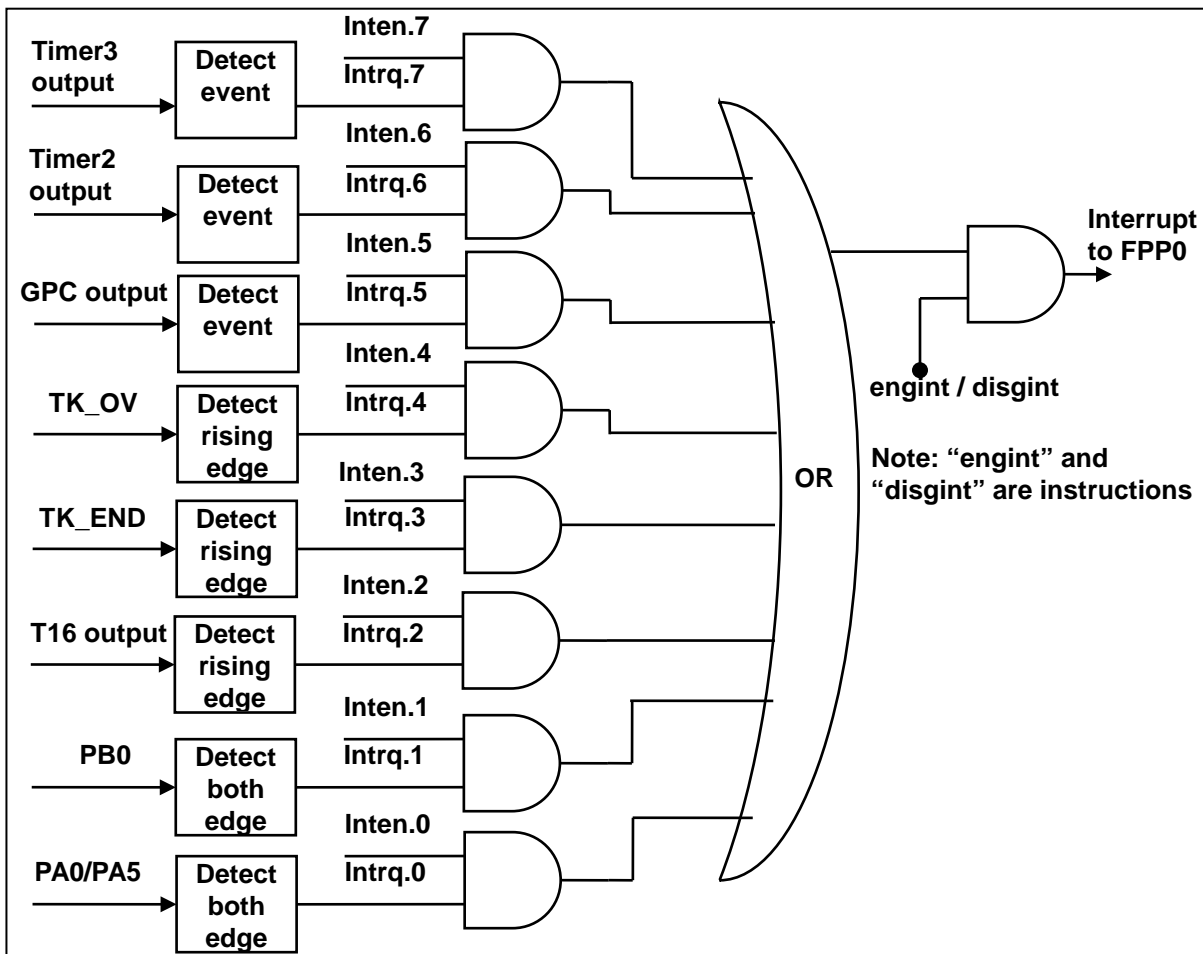

Fig. 11: Hardware diagram of Interrupt controller

Once the interrupt occurs, its operation will be:

- ◆ The program counter will be stored automatically to the stack memory specified by register *sp*.
- ◆ New *sp* will be updated to *sp+2*.
- ◆ Global interrupt will be disabled automatically.
- ◆ The next instruction will be fetched from address 0x010.

During the interrupt service routine, the interrupt source can be determined by reading the *intrq* register.

Note: Even if *INTEN=0*, *INTRQ* will be still triggered by the interrupt source.

After finishing the interrupt service routine and issuing the *reti* instruction to return back, its operation will be:

- ◆ The program counter will be restored automatically from the stack memory specified by register *sp*.
- ◆ New *sp* will be updated to *sp-2*.
- ◆ Global interrupt will be enabled automatically.
- ◆ The next instruction will be the original one before interrupt.

User must reserve enough stack memory for interrupt, two bytes stack memory for one level interrupt and four bytes for two levels interrupt. For interrupt operation, the following sample program shows how to handle the interrupt, noticing that it needs four bytes stack memory to handle one level interrupt and *pushaf*.

```
void      FPPA0  (void)
{
    ...
    $ INTEN PA0;          // INTEN =1; interrupt request when PA0 level changed
    INTRQ = 0;           // clear INTRQ
    ENGINT                // global interrupt enable
    ...
    DISGINT               // global interrupt disable
    ...
}
```

```

void Interrupt (void)           // interrupt service routine
{
    PUSHAF                     // store ALU and FLAG register

    // If INTEN.PA0 will be opened and closed dynamically,
    // user can judge whether INTEN.PA0 =1 or not.
    // Example: If (INTEN.PA0 && INTRQ.PA0) {...}

    // If INTEN.PA0 is always enable,
    // user can omit the INTEN.PA0 judgement to speed up interrupt service routine.

    If (INTRQ.PA0)
    {
        // Here for PA0 interrupt service routine
        INTRQ.PA0 = 0; // Delete corresponding bit (take PA0 for example)
        ...
    }
    ...
    // X: INTRQ = 0; // It is not recommended to use INTRQ = 0 to clear all at the end of
    // the
    // interrupt service routine.
    // It may accidentally clear out the interrupts that have just occurred
    // and are not yet processed.

    POPAF                      // restore ALU and FLAG register
}

```

### 5.9. Power-Save and Power-Down

There are three operational modes defined by hardware: ON mode, Power-Save mode and Power-Down modes. ON mode is the state of normal operation with all functions ON, Power-Save mode (“**stopexe**”) is the state to reduce operating current and CPU keeps ready to continue, Power-Down mode (“**stopsys**”) is used to save power deeply. Therefore, Power-Save mode is used in the system which needs low operating power with wake-up occasionally and Power-Down mode is used in the system which needs power down deeply with seldom wake-up. Table 4 shows the differences in oscillator modules between Power-Save mode (“**stopexe**”) and Power-Down mode (“**stopsys**”).

<b>Differences in oscillator modules between STOPSYS and STOPEXE</b>		
	IHRC	ILRC
STOPSYS	Stop	Stop
STOPEXE	No Change	No Change

Table 4: Differences in oscillator modules between STOPSYS and STOPEXE

#### 5.9.1. Power-Save mode (“**stopexe**”)

Using “**stopexe**” instruction to enter the Power-Save mode, only system clock is disabled, remaining all the oscillator modules be active. For CPU, it stops executing; however, for Timer16, counter keep counting if its clock source is not the system clock. The wake-up sources for “**stopexe**” can be IO-toggle or Timer16 counts to set values when the clock source of Timer16 is IHRC or ILRC modules, or wake-up by comparator when setting *GPCC.7=1* and *GPCS.6=1* to enable the comparator wake-up function at the same time. Wake-up from input pins can be considered as a continuation of normal execution, the detail information for Power-Save mode shows below:

- IHRC oscillator modules: No change, keep active if it was enabled
- ILRC oscillator modules: must remain enabled, need to start with ILRC when be wakening up
- System clock: Disable, therefore, CPU stops execution
- OTP memory is turned off
- Timer counter: Stop counting if system clock is selected by clock source or the corresponding oscillator module is disabled; otherwise, it keeps counting. (The Timer contains TM16, TM2, TM3)
- Wake-up sources:
  - a. IO toggle wake-up: IO toggling in digital input mode (*PxC* bit is 1 and *PxDIER* bit is 1).
  - b. Timer wake-up: If the clock source of Timer is not the SYSCLK, the system will be awakened when the Timer counter reaches the set value.
  - c. Comparator wake-up: It need setting *GPCC.7=1* and *GPCS.6=1* to enable the comparator wake-up function at the same time.

The watchdog timer must be disabled before issuing the “**stopexe**” command, the example is shown as below:

```

CLKMD.En_WatchDog = 0;      // disable watchdog timer
stopexe;
    ....                          // power saving
Wdreset;
CLKMD.En_WatchDog = 1;      // enable watchdog timer
  
```

Another example shows how to use Timer16 to wake-up from “*stopexe*”:

```

$ T16M IHRC, /1, BIT8 // Timer16 setting
...
WORD count = 0;
STT16 count;
stopexe;
...

```

The initial counting value of Timer16 is zero and the system will be waken up after the Timer16 counts 256 IHRC clocks.

### 5.9.2. Power-Down mode (“*stopsys*”)

Power-Down mode is the state of deeply power-saving with turning off all the oscillator modules. By using the “*stopsys*” instruction, this chip will be put on Power-Down mode directly. It is recommend to set GPCC.7=0 to disable the comparator before the command “*stopsys*”. The following shows the internal status of PMS164 in detail when “*stopsys*” command is issued:

- All the oscillator modules are turned off
- OTP memory is turned off
- The contents of SRAM and registers remain unchanged
- Wake-up sources: IO toggle in digital mode (PxDIER bit is 1)

Wake-up from input pins can be considered as a continuation of normal execution. To minimize power consumption, all the I/O pins should be carefully manipulated before entering power-down mode. The reference sample program for power down is shown as below:

```

CMKMD = 0xF4; // Change clock from IHRC to ILRC, disable watchdog timer
CLKMD.4 = 0; // disable IHRC
...
while (1)
{
    STOPSYS; // enter power-down
    if (...) break; // if wakeup happen and check OK, then return to high speed,
    // else stay in power-down mode again.
}
CLKMD = 0x34; // Change clock from ILRC to IHRC/2

```

### 5.9.3. Wake-up

After entering the Power-Down or Power-Save modes, the PMS164 can be resumed to normal operation by toggling IO pins, Timer wake-up is available for Power-Save mode ONLY. Table 5 shows the differences in wake-up sources between STOPSYS and STOPEXE.

Differences in wake-up sources between STOPSYS and STOPEXE		
	IO Toggle	Timer wake-up
STOPSYS	Yes	No
STOPEXE	Yes	Yes

Table 5: Differences in wake-up sources between Power-Save mode and Power-Down mode

When using the IO pins to wake-up the PMS164, registers **padier** and **pbdier** should be properly set to enable the wake-up function for every corresponding pin. The time for normal wake-up is about 2048 ILRC clocks counting from wake-up event.

Suspend mode	Wake-up mode	Wake-up time ( $t_{WUP}$ ) from IO toggle
STOPEXE suspend	normal wake-up	2048 * $T_{ILRC}$ , Where $T_{ILRC}$ is the clock period of ILRC
STOPSYS suspend	normal wake-up	2048 * $T_{ILRC}$ , Where $T_{ILRC}$ is the clock period of ILRC

Table 6: Suspend mode / Wake-up mode / Wake-up time from IO toggle

### 5.10. IO Pins

All the IO pins have the same structure except PA5 which has ONLY an open-drain output (without Q1 in Fig12) but its pull high is still functional by setting **paph.5**. When PMS164 is put in power-down or power-save mode, every pin can be used to wake-up system by toggling its state. Therefore, those pins needed to wake-up system must be set to input mode and set the corresponding bits of registers **padier** to high. The same reason, **padier.0** should be set to high when PA0 is used as external interrupt pin.

All these pins have Schmitt-trigger input buffer and output driver with CMOS level. When it is set to output low, the pull-up resistor is turned off automatically. If user wants to read the pin state, please notice that it should be set to input mode before reading the data port; if user reads the data port when it is set to output mode, the reading data comes from data register, NOT from IO pad. As an example, Table 7 shows the configuration table of bit 0 of port A. The hardware diagram of IO buffer is also shown as Fig. 12.

<b>pa.0</b>	<b>pac.0</b>	<b>paph.0</b>	<b>Description</b>
X	0	0	Input without pull-up resistor
X	0	1	Input with pull-up resistor
0	1	X	Output low without pull-up resistor
1	1	0	Output high without pull-up resistor
1	1	1	Output high with pull-up resistor

Table 7: PA0 Configuration Table

Fig. 12: Hardware diagram of IO buffer

Other than PA5, all the IO pins have the same structure; PA5 can be open-drain ONLY when setting to output mode (without Q1). When PMS164 is put in power-down or power-save mode, every pin can be used to wake-up system by toggling its state. Therefore, those pins needed to wake-up system must be set to input mode and set the corresponding bits of registers *padier* to high. The same reason, *padier*.0 should be set to high when PA0 is used as external interrupt pin.

### 5.11. Reset

There are many causes to reset the PMS164, once reset is asserted, all the registers in PMS164 will be set to default values, system should be restarted once abnormal cases happen, or by jumping program counter to address 'h0. The data memory is in uncertain state when reset comes from power-up and LVR; however, the content will be kept when reset comes from PRSTB pin or WDT timeout.

### 5.12. 8-bit Timer (Timer2/Timer3) with PWM generation

Two 8-bit hardware timers (Timer2 and Timer3) with PWM generation is implemented in the PMS164, The following descriptions thereafter are for Timer2 only. It is because Timer3 have same structure with Timer2. Please refer to Fig. 13 shown its hardware diagram, the clock sources of Timer2 may come from system clock, internal high RC oscillator (IHRC), internal low RC oscillator (ILRC), comparator, PB0, PA0 and PA4, bit [7:4] of register tm2c are used to select the clock of Timer2. Please notice that if IHRC is selected for Timer2 clock source, the clock sent to Timer2 will keep running when using ICE in halt state. According to the setting of register tm2c[3:2], Timer2 output can be selectively output to PA1 or PA2 or PA3. At this point, regardless of whether PX.x is the input or output state, Timer2 signal will be forced to output. A clock pre-scaling module is provided with divided-by-1, 4, 16, and 64 options, controlled by bit [6:5] of tm2s register; one scaling module with divided-by-1~31 is also provided and controlled by bit [4:0] of tm2s register. In conjunction of pre-scaling function and scaling function, the frequency of Timer2 clock (TM2\_CLK) can be wide range and flexible.

The Timer2 counter performs 8-bit up-counting operation only; the counter values can be set or read back by tm2ct register. The 8-bit counter will be clear to zero automatically when its values reach for upper bound register, the upper bound register is used to define the period of timer or duty of PWM. There are two operating modes for Timer2: period mode and PWM mode; period mode is used to generate periodical output waveform or interrupt event; PWM mode is used to generate PWM output waveform with optional 6-bit to 8-bit PWM resolution, Fig. 14 shows the timing diagram of Timer2 for both period mode and PWM mode.

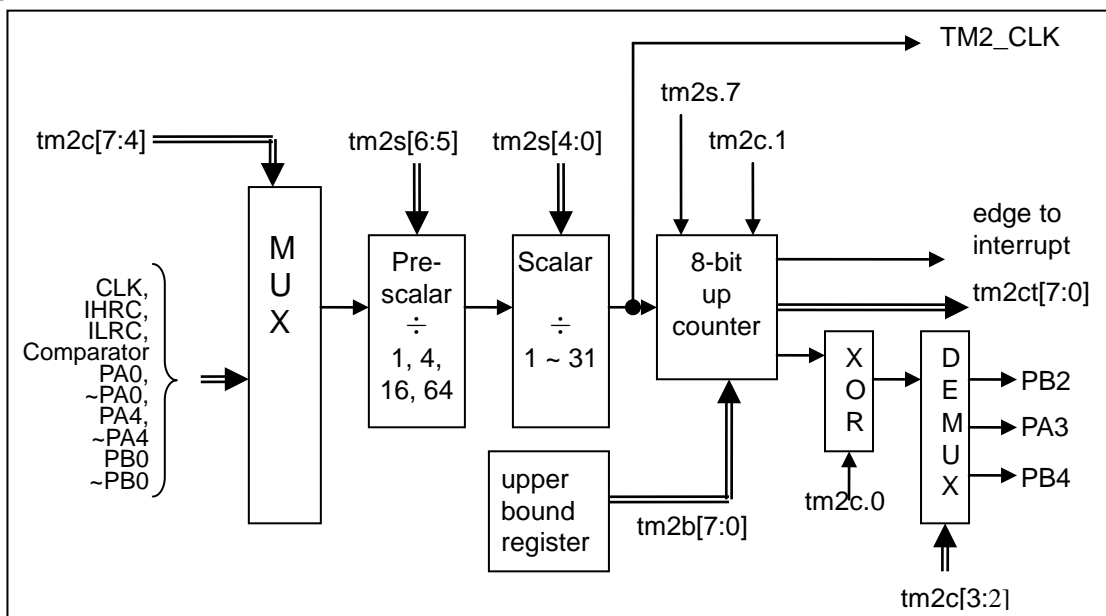

Fig. 13: Timer2 hardware diagram

The output of Timer3 can be sent to pin PB5, PB6 or PB7.

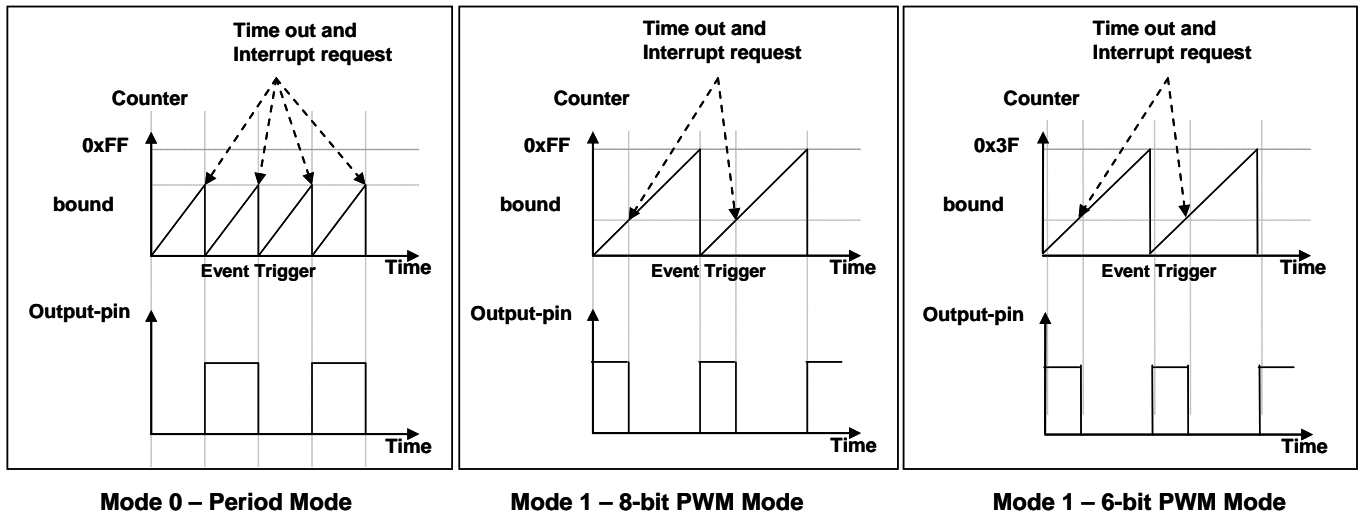

Fig. 14: Timing diagram of Timer2 in period mode and PWM mode (tm2c.1=1)

A Code Option GPC\_PWM is for the applications which need the generated PWM waveform to be controlled by the comparator result. If the Code Option GPC\_PWM is selected, the PWM output stops while the comparator output is 1 and then the PWM output turns on while the comparator output goes back to 0, as shown in Fig. 15.

Fig. 15: Comparator controls the output of PWM waveform

### 5.12.1. Using the Timer2 to generate periodical waveform

If periodical mode is selected, the duty cycle of output is always 50%; its frequency can be summarized as below:

$$\text{Frequency of Output} = Y \div [2 \times (K+1) \times S1 \times (S2+1)]$$

Where, Y = tm2c[7:4] : frequency of selected clock source

K = tm2b[7:0] : bound register in decimal

S1 = tm2s[6:5] : pre-scalar (S1= 1, 4, 16, 64)

S2 = tm2s[4:0] : scalar register in decimal (S2= 0 ~ 31)

Example 1:

tm2c = 0b0001\_1000, Y=8MHz

tm2b = 0b0111\_1111, K=127

tm2s = 0b0\_00\_00000, S1=1, S2=0

→ frequency of output = 8MHz ÷ [ 2 × (127+1) × 1 × (0+1) ] = 31.25kHz

Example 2:

```
tm2c = 0b0001_1000, Y=8MHz
tm2b = 0b0111_1111, K=127
tm2s[7:0] = 0b0_11_11111, S1=64 , S2 = 31
→ frequency = 8MHz ÷ ( 2 × (127+1) × 64 × (31+1) ) =15.25Hz
```

Example 3:

```
tm2c = 0b0001_1000, Y=8MHz
tm2b = 0b0000_1111, K=15
tm2s = 0b0_00_00000, S1=1, S2=0
→ frequency = 8MHz ÷ ( 2 × (15+1) × 1 × (0+1) ) = 250kHz
```

Example 4:

```
tm2c = 0b0001_1000, Y=8MHz
tm2b = 0b0000_0001, K=1
tm2s = 0b0_00_00000, S1=1, S2=0
→ frequency = 8MHz ÷ ( 2 × (1+1) × 1 × (0+1) ) =2MHz
```

The sample program for using the Timer2 to generate periodical waveform to PA3 is shown as below:

```
void FPPA0(void)
{
    .ADJUST_IC    SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V
    ...
    tm2ct = 0x00;
    tm2b = 0x7f;
    tm2s = 0b0_00_00001;           // 8-bit PWM, pre-scalar = 1, scalar = 2
    tm2c = 0b0001_10_0_0;         // system clock, output=PA3, period mode
    while(1)
    {
        nop;
    }
}
```

### 5.12.2. Using the Timer2 to generate 8-bit PWM waveform

If 8-bit PWM mode is selected, it should set **tm2c[1]=1** and **tm2s[7]=0**, the frequency and duty cycle of output waveform can be summarized as below:

$$\text{Frequency of Output} = Y \div [256 \times S1 \times (S2+1)]$$

$$\text{Duty of Output} = (K+1) \div 256 \times 100\%$$

Where, Y = tm2c[7:4] : frequency of selected clock source

K = tm2b[7:0] : bound register in decimal

S1 = tm2s[6:5] : pre-scalar (S1= 1, 4, 16, 64)

S2 = tm2s[4:0] : scalar register in decimal (S2= 0 ~ 31)

Example 1:

tm2c = 0b0001\_1010, Y=8MHz  
 tm2b = 0b0111\_1111, K=127  
 tm2s = 0b0\_00\_00000, S1=1, S2=0  
 → frequency of output =  $8\text{MHz} \div (256 \times 1 \times (0+1)) = 31.25\text{kHz}$   
 → duty of output =  $[(127+1) \div 256] \times 100\% = 50\%$

Example 2:

tm2c = 0b0001\_1010, Y=8MHz  
 tm2b = 0b0111\_1111, K=127  
 tm2s = 0b0\_11\_11111, S1=64, S2=31  
 → frequency of output =  $8\text{MHz} \div (256 \times 64 \times (31+1)) = 15.25\text{Hz}$   
 → duty of output =  $[(127+1) \div 256] \times 100\% = 50\%$

Example 3:

tm2c = 0b0001\_1010, Y=8MHz  
 tm2b = 0b1111\_1111, K=255  
 tm2s = 0b0\_00\_00000, S1=1, S2=0  
 → frequency of output =  $8\text{MHz} \div (256 \times 1 \times (0+1)) = 31.25\text{kHz}$   
 → duty of output =  $[(255+1) \div 256] \times 100\% = 100\%$

Example 4:

tm2c = 0b0001\_1010, Y=8MHz  
 tm2b = 0b0000\_1001, K = 9  
 tm2s = 0b0\_00\_00000, S1=1, S2=0  
 → frequency of output =  $8\text{MHz} \div (256 \times 1 \times (0+1)) = 31.25\text{kHz}$   
 → duty of output =  $[(9+1) \div 256] \times 100\% = 3.9\%$

The sample program for using the Timer2 to generate PWM waveform from PA3 is shown as below:

```

void    FPPA0 (void)
{
    .ADJUST_IC    SYSCLK=IHRC/2, IHRC=16MHz, VDD=5V
    wreset;
    tm2ct = 0x00;
    tm2b = 0x7f;
    tm2s = 0b0_00_00001;           // 8-bit PWM, pre-scalar = 1, scalar = 2
    tm2c = 0b0001_10_1_0;         // system clock, output=PA3, PWM mode
    while(1)
    {
        nop;
    }
}

```

### 5.12.3. Using the Timer2 to generate 6-bit PWM waveform

If 6-bit PWM mode is selected, it should set  $tm2c[1]=1$  and  $tm2s[7]=1$ , the frequency and duty cycle of output waveform can be summarized as below:

$$\text{Frequency of Output} = Y \div [64 \times S1 \times (S2+1)]$$

$$\text{Duty of Output} = [(K+1) \div 64] \times 100\%$$

Where,  $tm2c[7:4] = Y$  : frequency of selected clock source

$tm2b[7:0] = K$  : bound register in decimal

$tm2s[6:5] = S1$  : pre-scalar ( $S1 = 1, 4, 16, 64$ )

$tm2s[4:0] = S2$  : scalar register in decimal ( $S2 = 0 \sim 31$ )

#### Example 1:

$tm2c = 0b0001\_1010$ ,  $Y=8\text{MHz}$

$tm2b = 0b0001\_1111$ ,  $K=31$

$tm2s = 0b1\_00\_00000$ ,  $S1=1$ ,  $S2=0$

→ frequency of output =  $8\text{MHz} \div (64 \times 1 \times (0+1)) = 125\text{kHz}$

→ duty =  $[(31+1) \div 64] \times 100\% = 50\%$

#### Example 2:

$tm2c = 0b0001\_1010$ ,  $Y=8\text{MHz}$

$tm2b = 0b0001\_1111$ ,  $K=31$

$tm2s = 0b1\_11\_11111$ ,  $S1=64$ ,  $S2=31$

→ frequency of output =  $8\text{MHz} \div (64 \times 64 \times (31+1)) = 61.03 \text{ Hz}$

→ duty of output =  $[(31+1) \div 64] \times 100\% = 50\%$

#### Example 3:

$tm2c = 0b0001\_1010$ ,  $Y=8\text{MHz}$

$tm2b = 0b0011\_1111$ ,  $K=63$

$tm2s = 0b1\_00\_00000$ ,  $S1=1$ ,  $S2=0$

→ frequency of output =  $8\text{MHz} \div (64 \times 1 \times (0+1)) = 125\text{kHz}$

→ duty of output =  $[(63+1) \div 64] \times 100\% = 100\%$

#### Example 4:

$tm2c = 0b0001\_1010$ ,  $Y=8\text{MHz}$

$tm2b = 0b0000\_0000$ ,  $K=0$

$tm2s = 0b1\_00\_00000$ ,  $S1=1$ ,  $S2=0$

→ frequency =  $8\text{MHz} \div (64 \times 1 \times (0+1)) = 125\text{kHz}$

→ duty =  $[(0+1) \div 64] \times 100\% = 1.5\%$

### 5.13. Touch Function

A touch detecting circuit is included in PMS164. Its functional block diagram is shown as Fig.16.

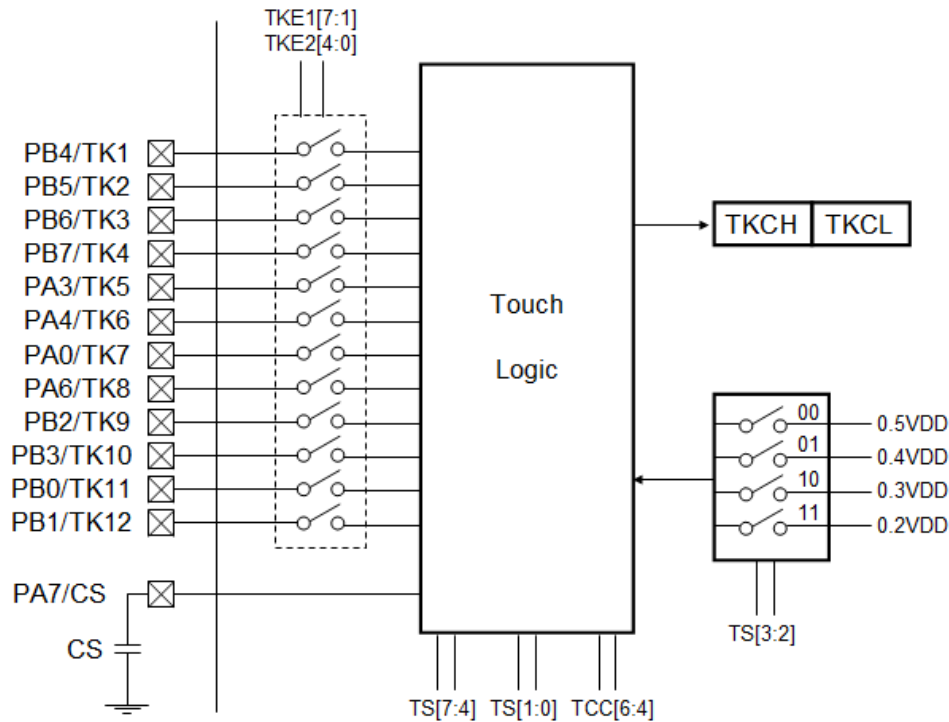

Fig. 16: Functional block diagram of the touch detecting circuit

The Touch detecting circuit in PMS164 applies the method of capacitive sensing, detecting the capacitive virtual ground effect of a finger, or the capacitance between sensors.

An accurate, low-leakage external capacitor CS is required to be connect between PA7/CS pin and GND. In the mean time, user should set the code option PA7\_Sel to be “As CS” to configure it as CS pin, instead of PA7.

For starting touch detecting process, user should follow the procedures below:

1. Selecting the touch pad to be measure by setting TKE1 & TKE2 registers. Only one pad should be selected a time.
2. Issuing a Touch START command by writing “0x10” into TCC register. The capacitor CS will be automatically discharged to VSS firstly. The discharging time is selectable from 32, 64 and 128 Touch clocks by **TS[1:0]**.
3. The larger the CS capacitance value, the longer the discharge time is needed to fully discharge the capacitor to VSS. However, in some cases, 128 Touch clocks may still be not long enough to fully discharge the CS capacitor. At this time, user should do it manually by writing “0x30” into TCC register instead of “0x10”. After a certain discharge time decided by the user, user can issue a Touch START (0x10) command to continue this touch conversion progress. Or user can also abort the conversion progress by writing “0x00” into TCC register.

4. After discharging, the CS will be charged toward VCC per Touch clock (TK\_CLK). The charging speed is determined by the capacitance value of the selected Touch pad.
5. The charging progress will be stopped automatically when its voltage reaches the internal generated threshold voltage (VREF). The program determines whether the charging process is stopped by reading TCC[6:4] or INTRQ[3].  
The VREF voltage is selectable from  $0.2 \cdot VCC$ ,  $0.3 \cdot VCC$ ,  $0.4 \cdot VCC$  and  $0.5 \cdot VCC$  by **TS[3:2]**.
6. By reading the Touch Counter value from TKCH & TKCL registers, user can monitor the capacitance value change of the Touch pad. The value reads from Touch Counter is related to the ratio of CS and CP, while CP represents the total capacitance that is the combination of PCB, wire and touch pad whose capacitance can be varied by human finger's touch. Once the CP value is altered, the periods required to charge the CS to VREF shorten. By counting the discrepancy of clock periods, the circuitry can decide if the touch pad is enabled.

Fig. 17: Timing diagram of Touch converting progress

**Note:** When the VREF voltage is first set or the reference voltage option is switched midway, please discard the first *TKCH* and *TKCL* data read after that.

### 6. IO Registers

#### 6.1. ACC Status Flag Register (*flag*), IO address = 0x00

Bit	Reset	R/W	Description
7 - 4	-	-	Reserved. These four bits are "1" when read.
3	-	R/W	OV (Overflow). This bit is set whenever the sign operation is overflow.
2	-	R/W	AC (Auxiliary Carry). There are two conditions to set this bit, the first one is carry out of low nibble in addition operation, and the other one is borrow from the high nibble into low nibble in subtraction operation.
1	-	R/W	C (Carry). There are two conditions to set this bit, the first one is carry out in addition operation, and the other one is borrow in subtraction operation. Carry is also affected by shift with carry instruction.
0	-	R/W	Z (Zero). This bit will be set when the result of arithmetic or logic operation is zero; Otherwise, it is cleared.

#### 6.2. Stack Pointer Register (*sp*), IO address = 0x02

Bit	Reset	R/W	Description
7 - 0	-	R/W	Stack Pointer Register. Read out the current stack pointer, or write to change the stack pointer. Please notice that bit 0 should be kept 0 due to program counter is 16 bits.

#### 6.3. Clock Mode Register (*clkmd*), IO address = 0x03

Bit	Reset	R/W	Description													
7 - 5	111	R/W	System clock selection:													
			<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">Type 0, clkmd[3]=0</th> <th style="width: 50%;">Type 1, clkmd[3]=1</th> </tr> </thead> <tbody> <tr> <td>000: IHRC/4</td> <td>000: IHRC/16</td> </tr> <tr> <td>001: IHRC/2</td> <td>001: IHRC/8</td> </tr> <tr> <td>01x: reserved</td> <td>010: ILRC/16 (ICE doesn't support)</td> </tr> <tr> <td>100: reserved</td> <td>011: IHRC/32</td> </tr> <tr> <td>101: reserved</td> <td>100: IHRC/64</td> </tr> <tr> <td>110: ILRC/4</td> <td>110: ILRC/64 (ICE doesn't support)</td> </tr> <tr> <td>111: ILRC (default)</td> <td>1x1: reserved.</td> </tr> </tbody> </table>	Type 0, clkmd[3]=0	Type 1, clkmd[3]=1	000: IHRC/4	000: IHRC/16	001: IHRC/2	001: IHRC/8	01x: reserved	010: ILRC/16 (ICE doesn't support)	100: reserved	011: IHRC/32	101: reserved	100: IHRC/64	110: ILRC/4
Type 0, clkmd[3]=0	Type 1, clkmd[3]=1															
000: IHRC/4	000: IHRC/16															
001: IHRC/2	001: IHRC/8															
01x: reserved	010: ILRC/16 (ICE doesn't support)															
100: reserved	011: IHRC/32															
101: reserved	100: IHRC/64															
110: ILRC/4	110: ILRC/64 (ICE doesn't support)															
111: ILRC (default)	1x1: reserved.															
4	0	R/W	IHRC oscillator Enable. 0 / 1: disable / enable													
3	0	R/W	Clock Type Select. This bit is used to select the clock type in bit [7:5]. 0 / 1: Type 0 / Type 1													
2	1	R/W	ILRC Enable. 0 / 1: disable / enable If ILRC is disabled, watchdog timer is also disabled.													
1	1	R/W	Watch Dog Enable. 0 / 1: disable / enable													
0	0	R/W	Pin PA5/PRST# function. 0 / 1: PA5 / PRSTB													

### 6.4. Interrupt Enable Register (*inten*), IO address = 0x04

Bit	Reset	R/W	Description
7	0	R/W	Enable interrupt from Timer3. 0 / 1: disable / enable
6	0	R/W	Enable interrupt from Timer2. 0 / 1: disable / enable
5	0	R/W	Enable interrupt from comparator. 0 / 1: disable / enable
4	0	R/W	Enable interrupt from Touch Key TK_OV. 0 / 1: disable / enable
3	0	R/W	Enable interrupt from Touch Key TK_END. 0 / 1: disable / enable
2	0	R/W	Enable interrupt from Timer16 overflow. 0 / 1: disable / enable
1	0	R/W	Enable interrupt from PB0. 0 / 1: disable / enable
0	0	R/W	Enable interrupt from PA0 / PA5. 0 / 1: disable / enable

### 6.5. Interrupt Request Register (*intrq*), IO address = 0x05

Bit	Reset	R/W	Description
7	-	R/W	Interrupt Request from Timer3, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
6	-	R/W	Interrupt Request from Timer2, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
5	-	R/W	Interrupt Request from comparator, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
4	-	R/W	Interrupt Request from Touch Key TK_OV, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
3	-	R/W	Interrupt Request from Touch Key TK_END, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
2	-	R/W	Interrupt Request from Timer16, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
1	-	R/W	Interrupt Request from pin PB0, this bit is set by hardware and cleared by software. 0 / 1: No request / Request
0	-	R/W	Interrupt Request from pin PA0 / PA5, this bit is set by hardware and cleared by software. 0 / 1: No request / Request

### 6.6. Timer 16 mode Register (*t16m*), IO address = 0x06

Bit	Reset	R/W	Description
7 - 5	000	R/W	Timer Clock source selection 000: Timer 16 is disabled 001: CLK (system clock) 010: reserved 011: PA4 falling edge (from external pin) 100: IHRC 101: reserved 110: ILRC 111: PA0 falling edge (from external pin)
4 - 3	00	R/W	Internal clock divider. 00: ÷1 01: ÷4 10: ÷16 11: ÷64
2 - 0	000	R/W	Interrupt source selection. Interrupt event happens when selected bit is changed. 0 : bit 8 of Timer16 1 : bit 9 of Timer16 2 : bit 10 of Timer16 3 : bit 11 of Timer16 4 : bit 12 of Timer16 5 : bit 13 of Timer16 6 : bit 14 of Timer16 7 : bit 15 of Timer16

### 6.7. MISC Register (*misc*), IO address = 0x08

Bit	Reset	R/W	Description
7 - 3	-	-	Reserved
2	0	WO	Disable LVR function. 0 / 1 : Enable / Disable
1 - 0	00	WO	Watchdog time out period 00: 8K ILRC clock period 01: 16K ILRC clock period 10: 64K ILRC clock period 11: 256K ILRC clock period

### 6.8. External Oscillator setting Register (*eoscr*, *write only*), IO address = 0x0a

Bit	Reset	R/W	Description
7 - 1	-	-	Reserved. Please keep 0.
0	0	WO	Power-down the Bandgap and LVR hardware modules. 0 / 1: normal / power-down.

### 6.9. Interrupt Edge Select Register (*integs*), IO address = 0x0c

Bit	Reset	R/W	Description
7 - 5	-	-	Reserved. Please keep 0.
4	0	WO	Timer16 edge selection. 0 : rising edge to trigger interrupt 1 : falling edge to trigger interrupt
3 - 2	00	WO	PB0 edge selection. 00 : both rising edge and falling edge to trigger interrupt 01 : rising edge to trigger interrupt 10 : falling edge to trigger interrupt 11 : reserved.
1 - 0	00	WO	PA0 / PA5 edge selection. 00 : both rising edge and falling edge to trigger interrupt 01 : rising edge to trigger interrupt 10 : falling edge to trigger interrupt 11 : reserved.

### 6.10. Port A Digital Input Enable Register (*padier*), IO address = 0x0d

Bit	Reset	R/W	Description
7 - 6	11	WO	Enable PA7~PA6 digital input and wake up event. 1 / 0 : enable / disable These bits can be set to low to disable wake up from PA7~PA6 toggling.
5	1	WO	Enable PA5 digital input, wake up event and interrupt request. 1 / 0 : enable / disable This bit can be set to low to disable wake up from PA5 toggling and interrupt request from this pin.
4 - 3	11	WO	Enable PA4~PA3 digital input and wake up event. 1 / 0 : enable / disable These bits can be set to low to disable wake up from PA4~PA3 toggling.
2 - 1	-	-	Reserved.
0	1	WO	Enable PA0 digital input, wake up event and interrupt request. 1 / 0 : enable / disable This bit can be set to low to disable wake up from PA0 toggling and interrupt request from this pin.

### 6.11. Port B Digital Input Enable Register (*pbdir*), IO address = 0x0e

Bit	Reset	R/W	Description
7 - 1	0xFF	WO	Enable PB7 ~ PB1 digital input and wake-up event. 1 / 0 : enable / disable. These bit can be set to low to disable wake-up from PB7 ~ PB1 toggling.
0		WO	Enable PB0 digital input, wake-up event and interrupt request. 1 / 0 : enable / disable. This bit can be set to low to disable wake up from PB0 toggling and interrupt request from this pin.

### 6.12. Port A Data Registers (*pa*), IO address = 0x10

Bit	Reset	R/W	Description
7 - 0	8'h00	R/W	Data registers for Port A.

### 6.13. Port A Control Registers (*pac*), IO address = 0x11

Bit	Reset	R/W	Description
7 - 0	8'h00	R/W	Port A control registers. This register is used to define input mode or output mode for each corresponding pin of port A. 0 / 1: input / output.

### 6.14. Port A Pull-High Registers (*paph*), IO address = 0x12

Bit	Reset	R/W	Description
7 - 0	8'h00	R/W	Port A pull-high registers. This register is used to enable the internal pull-high device on each corresponding pin of port A. 0 / 1 : disable / enable

### 6.15. Port B Data Registers (*pb*), IO address = 0x14

Bit	Reset	R/W	Description
7 - 0	0'h00	R/W	Data registers for Port B.

### 6.16. Port B Control Registers (*pbc*), IO address = 0x15

Bit	Reset	R/W	Description
7 - 0	0'h00	R/W	Port B control registers. This register is used to define input mode or output mode for each corresponding pin of port B. 0 / 1: input / output

### 6.17. Port B Pull-High Registers (*pbph*), IO address = 0x16

Bit	Reset	R/W	Description
7 - 0	8'h00	R/W	Port B pull-high registers. This register is used to enable the internal pull-high device on each corresponding pin of port B. 0 / 1 : disable / enable

### 6.18. Comparator Control Register (*gpcc*), IO address = 0x18

Bit	Reset	R/W	Description
7	0	R/W	Enable comparator. 0 / 1 : disable / enable When this bit is set to enable, please also set the corresponding analog input pins to be digital disable to prevent IO leakage.
6	-	RO	Comparator result of comparator. 0: plus input < minus input 1: plus input > minus input
5	0	R/W	Select whether the comparator result output will be sampled by TM2_CLK? 0: result output NOT sampled by TM2_CLK 1: result output sampled by TM2_CLK
4	0	R/W	Inverse the polarity of result output of comparator. 0: polarity is NOT inversed. 1: polarity is inversed.
3 - 1	000	R/W	Selection the minus input (-) of comparator. 000 : PA3 001 : PA4 010 : Internal 1.20 volt bandgap reference voltage 011 : $V_{internal R}$ 100 : PB6 (not for EV5) 101 : PB7 (not for EV5) 11X: reserved
0	0	R/W	Selection the plus input (+) of comparator. 0 : $V_{internal R}$ 1 : PA4

### 6.19. Comparator Selection Register (*gpcs*), IO address = 0x19

Bit	Reset	R/W	Description
7	0	WO	Comparator output enable (to PA0). 0 / 1 : disable / enable
6	0	WO	Wakeup by comparator output enable. 0 / 1 : disable / enable
5	0	WO	Selection of high range of comparator.
4	0	WO	Selection of low range of comparator.
3 - 0	0000	WO	Selection the voltage level of comparator. 0000 (lowest) ~ 1111 (highest)

### 6.20. Reset Status Register (*rstst*), IO address = 0x1b

Bit	Reset (POR only)	R/W	Description
7	0	R/W	The reset flag for the Watch-Dog time-out. This bit is 1 when Watch-Dog reset occurs. Write 0 to clear this flag or POR clear.
6	0	R/W	The reset flag for the invalid code. This bit is 1 when invalid code reset occurs. Write 0 to clear this flag or POR clear.
5	0	-	Reserved. Please keep 0.
4	-	-	Reserved. Please keep 1.
3	-	R/W	The reset flag for the external reset pin (PA5). This bit is 1 when PA5 reset occurs. Write 0 to clear this flag.
2	-	R/W	VDD below 4V flag. This bit is 1 when the VDD voltage is lower than 4V. Write 0 to clear this flag. Please note that this bit will be 1 automatically when VDD is powered slowly. If necessary, it is recommended to clear this flag during the program initialization.
1	-	R/W	VDD below 3V flag. This bit is 1 when the VDD voltage is lower than 3V. Write 0 to clear this flag. Please note that this bit will be 1 automatically when VDD is powered slowly. If necessary, it is recommended to clear this flag during the program initialization.
0	-	R/W	VDD below 2V flag. This bit is 1 when the VDD voltage is lower than 2V. Write 0 to clear this flag. Please note that this bit will be 1 automatically when VDD is powered slowly. If necessary, it is recommended to clear this flag during the program initialization.

### 6.21. Timer2 Control Register (*tm2c*), IO address = 0x1c

Bit	Reset	R/W	Description
7 - 4	0000	R/W	Timer2 clock selection. 0000 : disable 0001 : system clock 0010 : internal high RC oscillator (IHRC) 0011 : reserved 0100 : ILRC 0101 : comparator output 011x : reserved 1000 : PA0 (rising edge) 1001 : ~PA0 (falling edge) 1010 : PB0 (rising edge) 1011 : ~PB0 (falling edge) 1100 : PA4 (rising edge) 1101 : ~PA4 (falling edge) <b>Notice:</b> In ICE mode and IHRC is selected for Timer2 clock, the clock sent to Timer2 does NOT be stopped, Timer2 will keep counting when ICE is in halt state.
3 - 2	00	R/W	Timer2 output selection. 00 : disable 01 : PB2 10 : PA3 11 : PB4
1	0	R/W	Timer2 mode selection. 0 / 1 : period mode / PWM mode
0	0	R/W	Enable to inverse the polarity of Timer2 output. 0 / 1 : disable / enable

### 6.22. Timer2 Counter Register (tm2ct), IO address = 0x1d

Bit	Reset	R/W	Description
7 - 0	0'h00	RO	Bit [7:0] of Timer2 counter register.

Note: Timer2 is designed for PWM mode and Period mode, so do not read tm2ct register.

### 6.23. Timer2 Scalar Register (tm2s), IO address = 0x17

Bit	Reset	R/W	Description
7	0	WO	PWM resolution selection. 0 : 8-bit 1 : 6-bit or 7-bit (by code option TMx_bit)
6 - 5	00	WO	Timer2 clock pre-scalar. 00 : ÷ 1 01 : ÷ 4 10 : ÷ 16 11 : ÷ 64
4 - 0	00000	WO	Timer2 clock scalar.

### 6.24. Timer2 Bound Register (tm2b), IO address = 0x09

Bit	Reset	R/W	Description
7 - 0	0'h00	WO	Timer2 bound register.

### 6.25. Timer3 Control Register (tm3c), IO address = 0x32

Bit	Reset	R/W	Description
7 - 4	0000	R/W	Timer3 clock selection. 0000 : disable 0001 : system clock 0010 : internal high RC oscillator (IHRC) 0011 : reserved 0100 : ILRC 0101 : comparator output 011x : reserved 1000 : PA0 (rising edge) 1001 : ~PA0 (falling edge) 1010 : PB0 (rising edge) 1011 : ~PB0 (falling edge) 1100 : PA4 (rising edge) 1101 : ~PA4 (falling edge) <b>Notice:</b> In ICE mode and IHRC is selected for Timer3 clock, the clock sent to Timer3 does NOT be stopped, Timer3 will keep counting when ICE is in halt state.
3 - 2	00	R/W	Timer3 output selection. 00 : disable 01 : PB5 10 : PB6 11 : PB7
1	0	R/W	Timer3 mode selection. 0 / 1 : period mode / PWM mode
0	0	R/W	Enable to inverse the polarity of Timer3 output. 0 / 1: disable / enable

### 6.26. Timer3 Counter Register (tm3ct), IO address = 0x33

Bit	Reset	R/W	Description
7 - 0	0'h00	R/W	Bit [7:0] of Timer3 counter register.

### 6.27. Timer3 Scalar Register (tm3s), IO address = 0x34

Bit	Reset	R/W	Description
7	0	WO	PWM resolution selection. 0 : 8-bit 1 : 6-bit or 7-bit (by code option TMx_bit)
6 - 5	00	WO	Timer3 clock pre-scalar. 00 : ÷ 1 01 : ÷ 4 10 : ÷ 16 11 : ÷ 64
4 - 0	00000	WO	Timer3 clock scalar.

### 6.28. Timer3 Bound Register (tm3b), IO address = 0x35

Bit	Reset	R/W	Description
7 - 0	0'h00	WO	Timer3 bound register.

### 6.29. Touch Selection Register (ts), IO address = 0x20

Bit	Reset	R/W	Description
7 - 4	-	R/W	Touch clock selection (TK_CLK) 0010: IHRC/4 0011: IHRC/8 0100: IHRC/16 0101: IHRC/32 0110: IHRC/64 0111: IHRC/128 1000: ILRC Others: reserved
3 - 2	00	R/W	Touch VREF selection 00: 0.5 * VCC 01: 0.4 * VCC 10: 0.3 * VCC 11: 0.2 * VCC
1 - 0	-	R/W	Select the discharge time before starting the touch function (TK_DISCHG) 00: reserved 01: 32 * CLK 10: 64 * CLK 11: 128 * CLK

### 6.30. Touch Charge Control Register (tcc), IO address = 0x21

Bit	Reset	R/W	Description		
7	-	-	Reserved		
6 - 4	-	R/W	Touch control and status		
			<b>Data</b>	<b>Command (W)</b>	<b>Status (R)</b>
			000	TK_STOP (Touch module power down)	Ready / End
			001	TK_RUN	Running
			011	Discharge (Discharge CS capacitor)	Discharging
			Others	Reserved	Reserved
3 - 0	-	-	reserved		

### 6.31. Touch Key Enable 2 Register (tke2), IO address = 0x22

Bit	Reset	R/W	Description
7 - 5	-	-	Reserved
4	0	R/W	Enable PB1/TK12. 0/1: disable/enable
3	0	R/W	Enable PB0/TK11. 0/1: disable/enable
2	0	R/W	Enable PB3/TK10. 0/1: disable/enable
1	0	R/W	Enable PB2/TK9. 0/1: disable/enable
0	0	R/W	Enable PA6/TK8. 0/1: disable/enable

### 6.32. Touch Key Enable 1 Register (tke1), IO address = 0x24

Bit	Reset	R/W	Description
7	0	R/W	Enable PA0/TK7. 0/1: disable/enable
6	0	R/W	Enable PA4/TK6. 0/1: disable/enable
5	0	R/W	Enable PA3/TK5. 0/1: disable/enable
4	0	R/W	Enable PB7/TK4. 0/1: disable/enable
3	0	R/W	Enable PB6/TK3. 0/1: disable/enable
2	0	R/W	Enable PB5/TK2. 0/1: disable/enable
1	0	R/W	Enable PB4/TK1. 0/1: disable/enable
0	-	-	reserved

### 6.33. Touch Key Charge Counter High Register (tkch), IO address = 0x2B

Bit	Reset	R/W	Description
7 - 4	-	-	Reserved
3 - 0	-	RO	tkc [11:8] of touch key charge counter.

### 6.34. Touch Key Charge Counter Low Register (tkcl), IO address = 0x2C

Bit	Reset	R/W	Description
7 - 0	-	RO	tkc [7:0] of touch key charge counter.

### 7. Instructions

Symbol	Description
ACC	Accumulator ( Abbreviation of accumulator )
a	Accumulator ( Symbol of accumulator in program )
sp	Stack pointer
flag	ACC status flag register
I	Immediate data
&	Logical AND
	Logical OR
←	Movement
^	Exclusive logic OR
+	Add
−	Subtraction
~	NOT (logical complement, 1's complement)
$\bar{\bar{\quad}}$	NEG (2's complement)
OV	Overflow (The operational result is out of range in signed 2's complement number system)
Z	Zero (If the result of ALU operation is zero, this bit is set to 1)
C	Carry (The operational result is to have carry out for addition or to borrow carry for subtraction in unsigned number system)
AC	Auxiliary Carry (If there is a carry out from low nibble after the result of ALU operation, this bit is set to 1)
M.n	Only addressed in 0~0x3F (0~63) is allowed

### 7.1. Data Transfer Instructions

<i>mov</i> a, I	<p>Move immediate data into ACC.  Example: <i>mov</i> a, 0x0f;  Result: a ← 0fh;  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>mov</i> M, a	<p>Move data from ACC into memory  Example: <i>mov</i> MEM, a;  Result: MEM ← a  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>mov</i> a, M	<p>Move data from memory into ACC  Example: <i>mov</i> a, MEM ;  Result: a ← MEM; Flag Z is set when MEM is zero.  Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>mov</i> a, IO	<p>Move data from IO into ACC  Example: <i>mov</i> a, pa ;  Result: a ← pa; Flag Z is set when pa is zero.  Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>mov</i> IO, a	<p>Move data from ACC into IO  Example: <i>mov</i> pa, a;  Result: pa ← a  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>ldt16</i> word	<p>Move 16-bit counting values in Timer16 to memory in word.  Example: <i>ldt16</i> word;  Result: word ← 16-bit timer  Affected flags: [N] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <pre> ----- word    T16val ;           // declare a RAM word ... clear   lb@ T16val ;       // clear T16val (LSB) clear   hb@ T16val ;       // clear T16val (MSB) stt16   T16val ;           // initial T16 with 0 ... set1    t16m.5 ;           // enable Timer16 ... set0    t16m.5 ;           // disable Timer 16 ldt16   T16val ;           // save the T16 counting value to T16val ----- </pre>

<i>stt16</i> word	<p>Store 16-bit data from memory in word to Timer16.</p> <p>Example: <i>stt16</i> word;</p> <p>Result: 16-bit timer ←word</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre style="margin: 0;">word    T16val ;           // declare a RAM word ... mov     a, 0x34 ; mov     lb@ T16val , a ; // move 0x34 to T16val (LSB) mov     a, 0x12 ; mov     hb@ T16val , a ; // move 0x12 to T16val (MSB) stt16   T16val ;           // initial T16 with 0x1234 ...</pre> <hr style="border-top: 1px dashed black;"/>
<i>idxm</i> a, index	<p>Move data from specified memory to ACC by indirect method. It needs 2T to execute this instruction.</p> <p>Example: <i>idxm</i> a, index;</p> <p>Result: a ← [index], where index is declared by word.</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre style="margin: 0;">word    RAMIndex ;         // declare a RAM pointer ... mov     a, 0x5B ;           // assign pointer to an address (LSB) mov     lb@RAMIndex, a ; // save pointer to RAM (LSB) mov     a, 0x00 ;           // assign 0x00 to an address (MSB), should be 0 mov     hb@RAMIndex, a ; // save pointer to RAM (MSB) ... idxm    a, RAMIndex ;      // move memory data in address 0x5B to ACC</pre> <hr style="border-top: 1px dashed black;"/>
<i>ldxm</i> index, a	<p>Move data from ACC to specified memory by indirect method. It needs 2T to execute this instruction.</p> <p>Example: <i>ldxm</i> index, a;</p> <p>Result: [index] ← a; where index is declared by word.</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre style="margin: 0;">word    RAMIndex ;         // declare a RAM pointer ... mov     a, 0x5B ;           // assign pointer to an address (LSB) mov     lb@RAMIndex, a ; // save pointer to RAM (LSB) mov     a, 0x00 ;           // assign 0x00 to an address (MSB), should be 0 mov     hb@RAMIndex, a ; // save pointer to RAM (MSB) ... mov     a, 0xA5 ; ldxm    RAMIndex, a ;      // move 0xA5 to memory in address 0x5B</pre> <hr style="border-top: 1px dashed black;"/>

<i>xch</i> <i>M</i>	<p>Exchange data between ACC and memory</p> <p>Example: <code>xch MEM ;</code></p> <p>Result:    <math>MEM \leftarrow a, a \leftarrow MEM</math></p> <p>Affected flags: <math>\{N\} Z \quad \{N\} C \quad \{N\} AC \quad \{N\} OV</math></p>
<i>pushaf</i>	<p>Move the ACC and flag register to memory that address specified in the stack pointer.</p> <p>Example: <code>pushaf;</code></p> <p>Result:    <math>[sp] \leftarrow \{flag, ACC\};</math>  <math>sp \leftarrow sp + 2 ;</math></p> <p>Affected flags: <math>\{N\} Z \quad \{N\} C \quad \{N\} AC \quad \{N\} OV</math></p> <p>Application Example:</p> <p>-----</p> <pre>.romadr 0x10 ;           // ISR entry address     pushaf ;           // put ACC and flag into stack memory     ...                // ISR program     ...                // ISR program     popaf ;            // restore ACC and flag from stack memory     reti ;</pre> <p>-----</p>
<i>popaf</i>	<p>Restore ACC and flag from the memory which address is specified in the stack pointer.</p> <p>Example: <code>popaf;</code></p> <p>Result:    <math>sp \leftarrow sp - 2 ;</math>  <math>\{Flag, ACC\} \leftarrow [sp] ;</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>

### 7.2. Arithmetic Operation Instructions

<i>add</i> <i>a, I</i>	<p>Add immediate data with ACC, then put result into ACC</p> <p>Example: <code>add a, 0x0f ;</code></p> <p>Result:    <math>a \leftarrow a + 0fh</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>
<i>add</i> <i>a, M</i>	<p>Add data in memory with ACC, then put result into ACC</p> <p>Example: <code>add a, MEM ;</code></p> <p>Result:    <math>a \leftarrow a + MEM</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>
<i>add</i> <i>M, a</i>	<p>Add data in memory with ACC, then put result into memory</p> <p>Example: <code>add MEM, a ;</code></p> <p>Result:    <math>MEM \leftarrow a + MEM</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>
<i>addc</i> <i>a, M</i>	<p>Add data in memory with ACC and carry bit, then put result into ACC</p> <p>Example: <code>addc a, MEM ;</code></p> <p>Result:    <math>a \leftarrow a + MEM + C</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>
<i>addc</i> <i>M, a</i>	<p>Add data in memory with ACC and carry bit, then put result into memory</p> <p>Example: <code>addc MEM, a ;</code></p> <p>Result:    <math>MEM \leftarrow a + MEM + C</math></p> <p>Affected flags: <math>\{Y\} Z \quad \{Y\} C \quad \{Y\} AC \quad \{Y\} OV</math></p>

<i>addc</i> a	Add carry with ACC, then put result into ACC Example: <i>addc</i> a ; Result: $a \leftarrow a + C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>addc</i> M	Add carry with memory, then put result into memory Example: <i>addc</i> MEM ; Result: $MEM \leftarrow MEM + C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>sub</i> a, I	Subtraction immediate data from ACC, then put result into ACC. Example: <i>sub</i> a, 0x0f; Result: $a \leftarrow a - 0fh$ ( $a + [2\text{'s complement of } 0fh]$ ) Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>sub</i> a, M	Subtraction data in memory from ACC, then put result into ACC Example: <i>sub</i> a, MEM ; Result: $a \leftarrow a - MEM$ ( $a + [2\text{'s complement of } M]$ ) Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>sub</i> M, a	Subtraction data in ACC from memory, then put result into memory Example: <i>sub</i> MEM, a ; Result: $MEM \leftarrow MEM - a$ ( $MEM + [2\text{'s complement of } a]$ ) Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>subc</i> a, M	Subtraction data in memory and carry from ACC, then put result into ACC Example: <i>subc</i> a, MEM ; Result: $a \leftarrow a - MEM - C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>subc</i> M, a	Subtraction ACC and carry bit from memory, then put result into memory Example: <i>subc</i> MEM, a ; Result: $MEM \leftarrow MEM - a - C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>subc</i> a	Subtraction carry from ACC, then put result into ACC Example: <i>subc</i> a ; Result: $a \leftarrow a - C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>subc</i> M	Subtraction carry from the content of memory, then put result into memory Example: <i>subc</i> MEM ; Result: $MEM \leftarrow MEM - C$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>inc</i> M	Increment the content of memory Example: <i>inc</i> MEM ; Result: $MEM \leftarrow MEM + 1$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>dec</i> M	Decrement the content of memory Example: <i>dec</i> MEM ; Result: $MEM \leftarrow MEM - 1$ Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>clear</i> M	Clear the content of memory Example: <i>clear</i> MEM ; Result: $MEM \leftarrow 0$ Affected flags: [N] Z [N] C [N] AC [N] OV

### 7.3. Shift Operation Instructions

<i>sr a</i>	Shift right of ACC, shift 0 to bit 7 Example: <i>sr a</i> ; Result: $a(0, b7, b6, b5, b4, b3, b2, b1) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow a(b0)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>src a</i>	Shift right of ACC with carry bit 7 to flag Example: <i>src a</i> ; Result: $a(c, b7, b6, b5, b4, b3, b2, b1) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow a(b0)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>sr M</i>	Shift right the content of memory, shift 0 to bit 7 Example: <i>sr MEM</i> ; Result: $MEM(0, b7, b6, b5, b4, b3, b2, b1) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow MEM(b0)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>src M</i>	Shift right of memory with carry bit 7 to flag Example: <i>src MEM</i> ; Result: $MEM(c, b7, b6, b5, b4, b3, b2, b1) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow MEM(b0)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>sl a</i>	Shift left of ACC shift 0 to bit 0 Example: <i>sl a</i> ; Result: $a(b6, b5, b4, b3, b2, b1, b0, 0) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow a(b7)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>slc a</i>	Shift left of ACC with carry bit 0 to flag Example: <i>slc a</i> ; Result: $a(b6, b5, b4, b3, b2, b1, b0, c) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow a(b7)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>sl M</i>	Shift left of memory, shift 0 to bit 0 Example: <i>sl MEM</i> ; Result: $MEM(b6, b5, b4, b3, b2, b1, b0, 0) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow MEM(b7)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>slc M</i>	Shift left of memory with carry bit 0 to flag Example: <i>slc MEM</i> ; Result: $MEM(b6, b5, b4, b3, b2, b1, b0, C) \leftarrow MEM(b7, b6, b5, b4, b3, b2, b1, b0)$ , $C \leftarrow MEM(b7)$ Affected flags: $\{N\} Z \{Y\} C \{N\} AC \{N\} OV$
<i>swap a</i>	Swap the high nibble and low nibble of ACC Example: <i>swap a</i> ; Result: $a(b3, b2, b1, b0, b7, b6, b5, b4) \leftarrow a(b7, b6, b5, b4, b3, b2, b1, b0)$ Affected flags: $\{N\} Z \{N\} C \{N\} AC \{N\} OV$

### 7.4. Logic Operation Instructions

<i>and</i> a, I	<p>Perform logic AND on ACC and immediate data, then put result into ACC</p> <p>Example: <i>and</i> a, 0x0f ;</p> <p>Result: <math>a \leftarrow a \&amp; 0fh</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>and</i> a, M	<p>Perform logic AND on ACC and memory, then put result into ACC</p> <p>Example: <i>and</i> a, RAM10 ;</p> <p>Result: <math>a \leftarrow a \&amp; RAM10</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>and</i> M, a	<p>Perform logic AND on ACC and memory, then put result into memory</p> <p>Example: <i>and</i> MEM, a ;</p> <p>Result: <math>MEM \leftarrow a \&amp; MEM</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>or</i> a, I	<p>Perform logic OR on ACC and immediate data, then put result into ACC</p> <p>Example: <i>or</i> a, 0x0f ;</p> <p>Result: <math>a \leftarrow a   0fh</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>or</i> a, M	<p>Perform logic OR on ACC and memory, then put result into ACC</p> <p>Example: <i>or</i> a, MEM ;</p> <p>Result: <math>a \leftarrow a   MEM</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>or</i> M, a	<p>Perform logic OR on ACC and memory, then put result into memory</p> <p>Example: <i>or</i> MEM, a ;</p> <p>Result: <math>MEM \leftarrow a   MEM</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>xor</i> a, I	<p>Perform logic XOR on ACC and immediate data, then put result into ACC</p> <p>Example: <i>xor</i> a, 0x0f ;</p> <p>Result: <math>a \leftarrow a \wedge 0fh</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>xor</i> IO, a	<p>Perform logic XOR on ACC and IO register, then put result into IO register</p> <p>Example: <i>xor</i> pa, a ;</p> <p>Result: <math>pa \leftarrow a \wedge pa</math> ; // pa is the data register of port A</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>xor</i> a, M	<p>Perform logic XOR on ACC and memory, then put result into ACC</p> <p>Example: <i>xor</i> a, MEM ;</p> <p>Result: <math>a \leftarrow a \wedge RAM10</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>xor</i> M, a	<p>Perform logic XOR on ACC and memory, then put result into memory</p> <p>Example: <i>xor</i> MEM, a ;</p> <p>Result: <math>MEM \leftarrow a \wedge MEM</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>
<i>not</i> a	<p>Perform 1's complement (logical complement) of ACC</p> <p>Example: <i>not</i> a ;</p> <p>Result: <math>a \leftarrow \sim a</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p>

	<p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> mov    a, 0x38 ; // ACC=0X38 not    a ;      // ACC=0XC7 </pre> <hr style="border-top: 1px dashed black;"/>
<i>not</i> M	<p>Perform 1's complement (logical complement) of memory</p> <p>Example: <i>not</i> MEM;</p> <p>Result: MEM ← <math>\sim</math>MEM</p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> mov    a, 0x38 ; mov    mem, a ; // mem = 0x38 not    mem ;    // mem = 0xC7 </pre> <hr style="border-top: 1px dashed black;"/>
<i>neg</i> a	<p>Perform 2's complement of ACC</p> <p>Example: <i>neg</i> a;</p> <p>Result: a ← <math>\bar{a}</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> mov    a, 0x38 ; // ACC=0X38 neg    a ;      // ACC=0XC8 </pre> <hr style="border-top: 1px dashed black;"/>
<i>neg</i> M	<p>Perform 2's complement of memory</p> <p>Example: <i>neg</i> MEM;</p> <p>Result: MEM ← <math>\bar{MEM}</math></p> <p>Affected flags: [Y] Z [N] C [N] AC [N] OV</p> <p>Application Example:</p> <hr style="border-top: 1px dashed black;"/> <pre> mov    a, 0x38 ; mov    mem, a ; // mem = 0x38 not    mem ;    // mem = 0xC8 </pre> <hr style="border-top: 1px dashed black;"/>

### 7.5. Bit Operation Instructions

<i>set0</i> IO.n	<p>Set bit n of IO port to low  Example: <i>set0</i> pa.5 ;  Result: set bit 5 of port A to low  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>set1</i> IO.n	<p>Set bit n of IO port to high  Example: <i>set1</i> pa.5 ;  Result: set bit 5 of port A to high  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>set0</i> M.n	<p>Set bit n of memory to low  Example: <i>set0</i> MEM.5 ;  Result: set bit 5 of MEM to low  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>set1</i> M.n	<p>Set bit n of memory to high  Example: <i>set1</i> MEM.5 ;  Result: set bit 5 of MEM to high  Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>swapc</i> IO.n	<p>Swap the nth bit of IO port with carry bit  Example: <i>swapc</i> IO.0;  Result: <math>C \leftarrow IO.0</math> , <math>IO.0 \leftarrow C</math>  When IO.0 is a port to output pin, carry C will be sent to IO.0;  When IO.0 is a port from input pin, IO.0 will be sent to carry C;  Affected flags: [N] Z [Y] C [N] AC [N] OV  Application Example1 (serial output) :  <pre> ... set1    pac.0 ;      // set PA.0 as output ... set0    flag.1 ;    // C=0 swapc   pa.0 ;      // move C to PA.0 (bit operation), PA.0=0 set1    flag.1 ;    // C=1 swapc   pa.0 ;      // move C to PA.0 (bit operation), PA.0=1 ... </pre> Application Example2 (serial input) :  <pre> ... set0    pac.0 ;      // set PA.0 as input ... swapc   pa.0 ;      // read PA.0 to C (bit operation) src     a ;          // shift C to bit 7 of ACC swapc   pa.0 ;      // read PA.0 to C (bit operation) src     a ;          // shift new C to bit 7, old C ... </pre> </p>

### 7.6. Conditional Operation Instructions

<i>ceqsn a, l</i>	<p>Compare ACC with immediate data and skip next instruction if both are equal. Flag will be changed like as (<math>a \leftarrow a - l</math>) Example: <i>ceqsn a, 0x55</i> ;           <i>inc MEM</i> ;           <i>goto error</i> ; Result: If <math>a=0x55</math>, then “goto error”; otherwise, “inc MEM”. Affected flags: [Y] Z [Y] C [Y] AC [Y] OV</p>
<i>ceqsn a, M</i>	<p>Compare ACC with memory and skip next instruction if both are equal. Flag will be changed like as (<math>a \leftarrow a - M</math>) Example: <i>ceqsn a, MEM</i> ; Result: If <math>a=MEM</math>, skip next instruction Affected flags: [Y] Z [Y] C [Y] AC [Y] OV</p>
<i>cneqsn a, M</i>	<p>Compare ACC with memory and skip next instruction if both are not equal. Flag will be changed like as (<math>a \leftarrow a - M</math>) Example: <i>cneqsn a, MEM</i> ; Result: If <math>a \neq MEM</math>, skip next instruction Affected flags: [Y] Z [Y] C [Y] AC [Y] OV</p>
<i>cneqsn a, l</i>	<p>Compare ACC with immediate data and skip next instruction if both are no equal. Flag will be changed like as (<math>a \leftarrow a - l</math>) Example: <i>cneqsn a, 0x55</i> ;           <i>inc MEM</i> ;           <i>goto error</i> ; Result: If <math>a \neq 0x55</math>, then “goto error”; Otherwise, “inc MEM”. Affected flags: [Y] Z [Y] C [Y] AC [Y] OV</p>
<i>t0sn IO.n</i>	<p>Check IO bit and skip next instruction if it's low Example: <i>t0sn pa.5</i> ; Result: If bit 5 of port A is low, skip next instruction Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>t1sn IO.n</i>	<p>Check IO bit and skip next instruction if it's high Example: <i>t1sn pa.5</i> ; Result: If bit 5 of port A is high, skip next instruction Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>t0sn M.n</i>	<p>Check memory bit and skip next instruction if it's low Example: <i>t0sn MEM.5</i> ; Result: If bit 5 of MEM is low, then skip next instruction Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>t1sn M.n</i>	<p>Check memory bit and skip next instruction if it's high Example: <i>t1sn MEM.5</i> ; Result: If bit 5 of MEM is high, then skip next instruction Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>izsn a</i>	<p>Increment ACC and skip next instruction if ACC is zero Example: <i>izsn a</i> ; Result: <math>a \leftarrow a + 1</math>, skip next instruction if <math>a = 0</math> Affected flags: [Y] Z [Y] C [Y] AC [Y] OV</p>

<i>dzn</i> a	Decrement ACC and skip next instruction if ACC is zero Example: <i>dzn</i> a; Result: $A \leftarrow A - 1$ , skip next instruction if a = 0 Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>izn</i> M	Increment memory and skip next instruction if memory is zero Example: <i>izn</i> MEM; Result: $MEM \leftarrow MEM + 1$ , skip next instruction if MEM= 0 Affected flags: [Y] Z [Y] C [Y] AC [Y] OV
<i>dzn</i> M	Decrement memory and skip next instruction if memory is zero Example: <i>dzn</i> MEM; Result: $MEM \leftarrow MEM - 1$ , skip next instruction if MEM = 0 Affected flags: [Y] Z [Y] C [Y] AC [Y] OV

### 7.7. System control Instructions

<i>call</i> label	Function call, address can be full range address space Example: <i>call</i> function1; Result: [sp] $\leftarrow$ pc + 1 pc $\leftarrow$ function1 sp $\leftarrow$ sp + 2 Affected flags: [N] Z [N] C [N] AC [N] OV
<i>goto</i> label	Go to specific address which can be full range address space Example: <i>goto</i> error; Result: Go to error and execute program. Affected flags: [N] Z [N] C [N] AC [N] OV
<i>ret</i> I	Place immediate data to ACC, then return Example: <i>ret</i> 0x55; Result: $A \leftarrow 55h$ ret ; Affected flags: [N] Z [N] C [N] AC [N] OV
<i>ret</i>	Return to program which had function call Example: <i>ret</i> ; Result: sp $\leftarrow$ sp - 2 pc $\leftarrow$ [sp] Affected flags: [N] Z [N] C [N] AC [N] OV
<i>reti</i>	Return to program that is interrupt service routine. After this command is executed, global interrupt is enabled automatically. Example: <i>reti</i> ; Affected flags: [N] Z [N] C [N] AC [N] OV
<i>nop</i>	No operation Example: <i>nop</i> ; Result: nothing changed Affected flags: [N] Z [N] C [N] AC [N] OV
<i>pcadd</i> a	Next program counter is current program counter plus ACC. Example: <i>pcadd</i> a; Result: pc $\leftarrow$ pc + a Affected flags: [N] Z [N] C [N] AC [N] OV

	<p>Application Example:</p> <p>-----</p> <pre> ... mov    a, 0x02 ; pcadd  a ;           // PC &lt;- PC+2 goto   err1 ; goto   correct ;    // jump here goto   err2 ; goto   err3 ; ... correct:           // jump here ... </pre> <p>-----</p>
<i>engint</i>	<p>Enable global interrupt enable</p> <p>Example: <i>engint</i>;</p> <p>Result: Interrupt request can be sent to FPP0</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>disgint</i>	<p>Disable global interrupt enable</p> <p>Example: <i>disgint</i> ;</p> <p>Result: Interrupt request is blocked from FPP0</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>stopsys</i>	<p>System halt.</p> <p>Example: <i>stopsys</i>;</p> <p>Result: Stop the system clocks and halt the system</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>stopexe</i>	<p>CPU halt. The oscillator module is still active to output clock, however, system clock is disabled to save power.</p> <p>Example: <i>stopexe</i>;</p> <p>Result: Stop the system clocks and keep oscillator modules active.</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>reset</i>	<p>Reset the whole chip, its operation will be same as hardware reset.</p> <p>Example: <i>reset</i>;</p> <p>Result: Reset the whole chip.</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>
<i>wdreset</i>	<p>Reset Watchdog timer.</p> <p>Example: <i>wdreset</i> ;</p> <p>Result: Reset Watchdog timer.</p> <p>Affected flags: [N] Z [N] C [N] AC [N] OV</p>

### 7.8. Summary of Instructions Execution Cycle

2T		<i>goto, call, pcadd, ret, reti, idxm</i>
2T	Condition is fulfilled.	<i>ceqsn, cneqsn, t0sn, t1sn, dzsn, izsn</i>
1T	Condition is not fulfilled.	
1T		Others

### 7.9. Summary of affected flags by Instructions

Instruction	Z	C	AC	OV	Instruction	Z	C	AC	OV	Instruction	Z	C	AC	OV
<i>mov</i> a, l	-	-	-	-	<i>mov</i> M, a	-	-	-	-	<i>mov</i> a, M	Y	-	-	-
<i>mov</i> a, IO	Y	-	-	-	<i>mov</i> IO, a	-	-	-	-	<i>ldt16</i> word	-	-	-	-
<i>stt16</i> word	-	-	-	-	<i>idxm</i> a, index	-	-	-	-	<i>idxm</i> index, a	-	-	-	-

### 7.10. BIT definition

Bit access of RAM is only available for address from 0x00 to 0x3F.

### 8. Code Option Table

Option	Selection	Description
Security	Enable	OTP content is protected and program cannot be read back
	Disable	OTP content is not protected so program can be read back
LVR	4.0V	LVR typical range 4.0V
	3.5V	LVR typical range 3.5V
	3.0V	LVR typical range 3.0V
	2.75V	LVR typical range 2.75V
	2.5V	LVR typical range 2.5V
	2.2V	LVR typical range 2.2V
	2.0V	LVR typical range 2.0V
	1.8V	LVR typical range 1.8V
Drive	Low	IO Drive/Sink current is Low
	Normal	IO Drive/Sink current is Normal
TMx_Source	16MHZ	When tm2c[7:4]= 0010, TM2 clock source = IHRC = 16MHZ When tm3c[7:4]= 0010, TM3 clock source = IHRC = 16MHZ
	32MHZ	When tm2c[7:4]= 0010, TM2 clock source = IHRC*2 = 32MHZ When tm3c[7:4]= 0010, TM3 clock source = IHRC*2 = 32MHZ (ICE doesn't support.)
TMx_Bit	6 Bit	When tm2s.7=1, TM2 PWM resolution is 6 Bit When tm3s.7=1, TM3 PWM resolution is 6 Bit
	7 Bit	When tm2s.7=1, TM2 PWM resolution is 7 Bit When tm3s.7=1, TM3 PWM resolution is 7 Bit (ICE doesn't support.)
Comparator Edge	All Edge	GPC INT both Rising & Falling edge trigger
	Rising_Edge	GPC INT both Rising edge trigger
	Falling_Edge	GPC INT both Falling edge trigger
GPC_PWM	Disable	Comparator does not control all PWM outputs
	Enable	Comparator controls all PWM outputs (ICE doesn't support.)
Interrupt Src0	PA.0	INTEN/INTRQ.Bit0 is from PA.0
	PA.5	INTEN/INTRQ.Bit0 is from PA.5 (ICE doesn't support.)
PA7_Sel	As_CS	Configure pad PA7/CS as CS pad of Touch
	As_IO	Configure pad PA7/CS as normal PA7 IO pad
EMI	Disable	Disable EMI optimize option
	Enable	The system clock will be slightly vibrated for better EMI performance

Table 8: Code Option

## 9. Special Notes

This chapter is to remind user who use PMS164 IC in order to avoid frequent errors upon operation.

### 9.1. Warning

User must read all application notes of the IC by detail before using it. Please download the related application notes from the company website.

### 9.2. Using IC

#### 9.2.1. IO pin usage and setting

- (1) IO pin is set to be digital input
  - ◆ When IO is as digital input, the level of  $V_{ih}$  and  $V_{il}$  would changes with the voltage and temperature. Please follow the minimum value of  $V_{ih}$  and the maximum value of  $V_{il}$ .
  - ◆ The value of internal pull high resistor would also changes with the voltage, temperature and pin voltage. It is not the fixed value.
- (2) IO pin is set to be digital input and enable wakeup function
  - ◆ Configure IO pin as input
  - ◆ Set PADIER and PBDIER registers to set the corresponding bit to 1.
- (3) PA5 is set to be output pin
  - ◆ PA5 can be set to be Open-Drain output pin only, output high requires adding pull-up resistor.
- (4) PA5 is set to be PRSTB input pin
  - ◆ Configure PA5 as input
  - ◆ Set CLKMD.0=1 to enable PA5 as PRSTB input pin
- (5) PA5 is set to be input pin and to connect with a push button or a switch by a long wire
  - ◆ Needs to put a  $>33\Omega$  resistor in between PA5 and the long wire
  - ◆ Avoid using PA5 as input in such application.

#### 9.2.2. Interrupt

- (1) When using the interrupt function, the procedure should be:
  - Step1: Set INTEN register, enable the interrupt control bit.
  - Step2: Clear INTRQ register.
  - Step3: In the main program, using ENGINT to enable CPU interrupt function.
  - Step4: Wait for interrupt. When interrupt occurs, enter to Interrupt Service Routine.
  - Step5: After the Interrupt Service Routine being executed, return to the main program.
  - \*Use DISGINT in the main program to disable all interrupts.
  - \*When interrupt service routine starts, use PUSHAF instruction to save ALU and FLAG register. POPAF instruction is to restore ALU and FLAG register before RETI as below:

```
void Interrupt (void) // Once the interrupt occurs, jump to interrupt service routine
```

```

{                                     // enter DISGINT status automatically, no more interrupt is accepted
    PUSHAF;
    ...
    POPAF;
} // RETI will be added automatically. After RETI being executed, ENGINT status will be restored

```

(2) INTEN and INTRQ have no initial values. Please set required value before enabling interrupt function.

### 9.2.3. System clock switching

System clock can be switched by CLKMD register. Please notice that, NEVER switch the system clock and turn off the original clock source at the same time. For example: When switching from clock A to clock B, please switch to clock B first; and after that turn off the clock A oscillator through CLKMD.

- ◆ Switch system clock from ILRC to IHRC/2
 

```

CLKMD = 0x36;           // switch to IHRC, ILRC can not be disabled here
CLKMD.2 = 0;           // ILRC can be disabled at this time

```
- ◆ **ERROR.** Switch ILRC to IHRC and turn off ILRC simultaneously
 

```

CLKMD = 0x50;           // MCU will hang

```

### 9.2.4. Power down mode, wakeup and watchdog

Watchdog will be inactive once ILRC is disabled.

### 9.2.5. TIMER time out

When select \$ INTEGS BIT\_R (default value) and T16M counter BIT8 to generate interrupt, if T16M counts from 0, the first interrupt will occur when the counter reaches to 0x100 (BIT8 from 0 to 1) and the second interrupt will occur when the counter reaches 0x300 (BIT8 from 0 to 1). Therefore, selecting BIT8 as 1 to generate interrupt means that the interrupt occurs every 512 counts. Please notice that if T16M counter is restarted, the next interrupt will occur once Bit8 turns from 0 to 1.

If select \$ INTEGS BIT\_F (BIT triggers from 1 to 0) and T16M counter BIT8 to generate interrupt, the T16M counter changes to an interrupt every 0x200/0x400/0x600/. Please pay attention to two differences with setting INTEGS methods.

### 9.2.6. IHRC

- (1) The IHRC frequency calibration is performed when IC is programmed by the writer.
- (2) Because the characteristic of the Epoxy Molding Compound (EMC) would some degrees affects the IHRC frequency (either for package or COB), if the calibration is done before molding process, the actual IHRC frequency after molding may be deviated or becomes out of spec. Normally , the frequency is getting slower a bit.
- (3) It usually happens in COB package or Quick Turnover Programming (QTP). And PADAUK would not take any responsibility for this situation.

- (4) Users can make some compensatory adjustments according to their own experiences. For example, users can set IHRC frequency to be 0.5% ~ 1% higher and aim to get better re-targeting after molding.

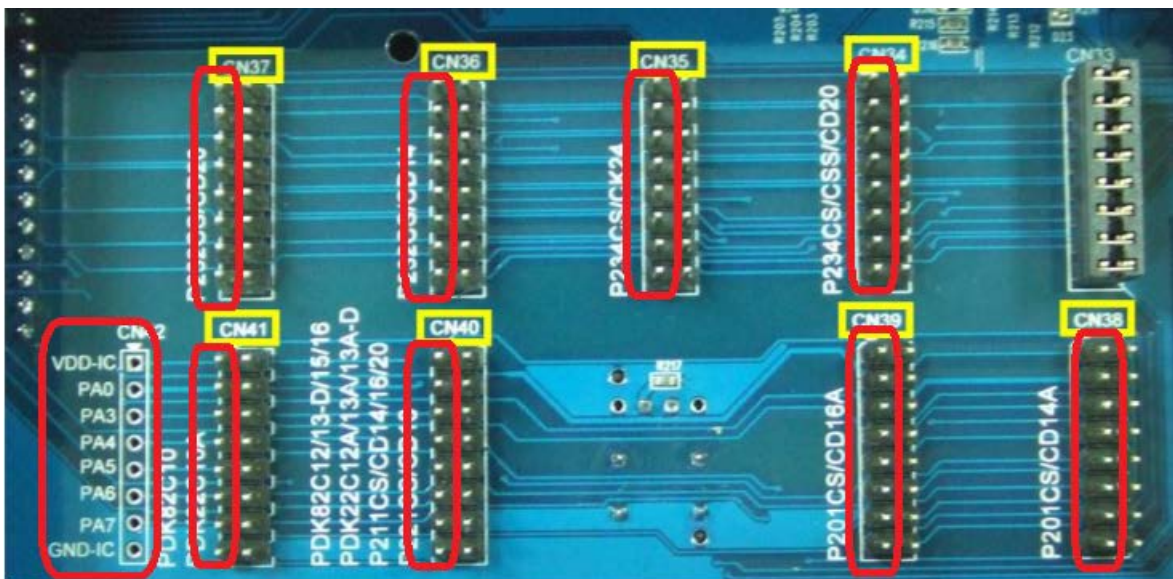

### 9.2.7. LVR

User can set MISC.2 as "1" to disable LVR. However,  $V_{DD}$  must be kept as exceeding the lowest working voltage of chip; Otherwise IC may work abnormally.

### 9.2.8. Programming Writing

There are 6 signals for programming PMS164: PA3, PA4, PA5, PA6,  $V_{DD}$ , and GND.

If using 3S-P-002 to program PMS164, please put the jumper over CN39. For S16 package, please put the IC at the very top of the Textool. For S08A package, please put the IC downwards by four spaces from the top of the Textool. Other packages could be programmed by appropriate connection by the users. All the signals on the left side pins of the jumper are identical and same as the labeled on CN42 at left bottom corner: they are  $V_{DD}$ , PA0 (not required), PA3, PA4, PA5, PA6, PA7(not required), and GND.

If user use 5S-P-003 or above to program, please follow the instruction displayed at the software to connect the jumper.

- Special notes about voltage and current while Multi-Chip-Package(MCP) or On-Board Programming
  - (1) PA5 ( $V_{PP}$ ) may be higher than 11V.
  - (2)  $V_{DD}$  may be higher than 6.5V, and its maximum current may reach about 20mA.
  - (3) All other signal pins level (except GND) are the same as  $V_{DD}$ .

User should confirm when using this product in MCP or On-Board Programming, the peripheral circuit or components will not be destroyed or limit the above voltages.

### 9.3. Using ICE

(1) The following items should be noted when using 5S-I-S01/2(B) to emulate PMS164:

- 5S-I-S01/2(B) doesn't support SYSCLK=ILRC/16 and ILRC/64.
- 5S-I-S01/2(B) doesn't support PA5 as the interrupt source.
- 5S-I-S01/2(B) doesn't support the code options: GPC\_PWM, TMx\_source, TMx\_bit.
- 5S-I-S01/2(B) doesn't support ALL touch function.
- The PA3 output function will be affected when GPCS selects output to PA0 output.
- When simulating PWM waveform, please check the waveform during program running. When the ICE is suspended or single-step running, its waveform may be inconsistent with the reality.
- The ILRC frequency of the PDK5S-I-S01/2(B) simulator is different from the actual IC and is uncalibrated, with a frequency range of about 34K~38KHz.
- Fast Wakeup time is different from 5S-I-S01/2(B): 128 SysClk, PMS164: 45 ILRC.
- Watch dog time out period is different from 5S-I-S01/2(B).

WDT period	5S-I-S01/2(B)	PMS164
misc[1:0]=00	2048 * T <sub>ILRC</sub>	8192 * T <sub>ILRC</sub>
misc[1:0]=01	4096 * T <sub>ILRC</sub>	16384 * T <sub>ILRC</sub>
misc[1:0]=10	16384 * T <sub>ILRC</sub>	65536 * T <sub>ILRC</sub>
misc[1:0]=11	256 * T <sub>ILRC</sub>	262144 * T <sub>ILRC</sub>
