TIMING DIAGRAMS

TIMING WAVEFORM OF READ CYCLE(1) (Address Transition Controlled)

TIMING WAVEFORM OF READ CYCLE(2) ($\overline{\text{OE}}$ Controlled)

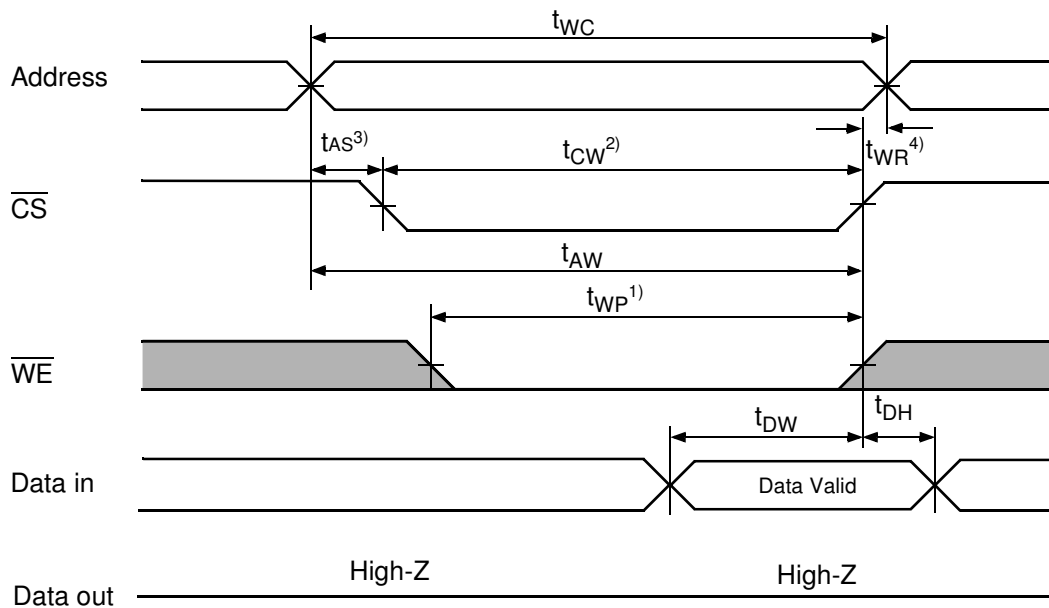

NOTES (READ CYCLE)

1. t_{HZ} and t_{OHZ} are defined as the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, $t_{\text{HZ}}(\text{Max.})$ is less than $t_{\text{LZ}}(\text{Min.})$ both for a given device and from device to device interconnection.

TIMING WAVEFORM OF WRITE CYCLE(1) (\overline{WE} Controlled, \overline{OE} High During WRITE)

TIMING WAVEFORM OF WRITE CYCLE(2) (\overline{CS} Controlled)

TIMING WAVEFORM OF WRITE CYCLE(3) (\overline{WE} Controlled, \overline{OE} LOW)

NOTES (WRITE CYCLE)

1. A write occurs during the overlap(t_{WP}) of low \overline{CS} and low \overline{WE} . A write begins at the latest transition among \overline{CS} goes low and \overline{WE} goes low. A write ends at the earliest transition when \overline{CS} goes high and \overline{WE} goes high. The t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the \overline{CS} going low to end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as \overline{CS} or \overline{WE} going high.
