#### Description

The IVA-05208 is a variable gain amplifier housed in a miniature low cost plastic surface mount package. This device can be used in any combination of single-ended or differential inputs or outputs (see Functional Block Diagram). The lowest frequency of operation is limited only by the values of user selected blocking and bypass capacitors.

Typical applications include variable gain amplification for fiber optic systems (e.g., SONET) with data rates up to 2.0 Gb/s, mobile radio and satellite receivers, millimeter wave receiver IF amplifiers and communication receivers.

#### SO-8 Package

The IVA series of variable gain amplifiers is fabricated using HP's 10 GHz  $f_T$ , 25 GHz  $f_{MAX}$  ISOSAT™-I silicon bipolar process. This process uses nitride self-alignment, submicrometer lithography, trench isolation, ion implantation, gold metallization and polyimide inter-metal dielectric and scratch protection to achieve excellent performance, uniformity and reliability.

### Typical Biasing Configuration and Functional Block Diagram

#### Differential Input/Differential Output

$C_{bypass} = 1000\text{ pF}$  typical  
Good grounding of Pins 2, 3 is critical for proper operation and good VSWR performance of this part.

#### Single Ended Input/Single Ended Output

\* Optional: For Single-Ended Output operation, Pin 7 may be left unterminated (no  $C_{block}$  or  $50\ \Omega$ )

#### Notes:

1. The recommended operating voltage range for this device is 4 to 6 V. Typical performance as a function of voltage is on the following page.
2. As measured using Input Pin 1 and Output Pin 6, with Output Pin 7 terminated into 50 ohms and Input Pin 4 at AC ground.
3. Referenced from 50 MHz Gain.
4. The recommended gain control range for these devices for dynamic control is 0 to 4.2 V. Operation at gain control settings above 4.2V may result in gain increase rather than gain decrease.
