

TwinDie™ 1.2V DDR4 SDRAM

MT40A2G4 – 128 Meg x 4 x 16 Banks x 2 Ranks

MT40A1G8 – 64 Meg x 8 x 16 Banks x 2 Ranks

Description

The 8Gb (TwinDie™) DDR4 SDRAM uses Micron's 4Gb DDR4 SDRAM die (essentially two ranks of the 4Gb DDR4 SDRAM). Refer to Micron's 4Gb DDR4 SDRAM data sheet for the specifications not included in this document. Specifications for base part number MT40A1G4 correlate to TwinDie manufacturing part number MT40A2G4; specifications for base part number MT40A512M8 correlate to TwinDie manufacturing part number MT40A1G8.

Features

- Uses 4Gb Micron die
- Two ranks (includes dual CS#, ODT, and CKE balls)
- Each rank has 4 groups of 4 internal banks for concurrent operation
- $V_{DD} = V_{DDQ} = 1.2V$ (1.14–1.26V)
- 1.2V V_{DDQ} -terminated I/O
- JEDEC-standard ball-out
- Low-profile package
- T_C of 0°C to 95°C
 - 0°C to 85°C: 8192 refresh cycles in 64ms
 - 85°C to 95°C: 8192 refresh cycles in 32ms

Options

- Configuration

N	V _{SS}	A11	PAR				A17/NC	A13	V _{DD}	N

- Notes:
1. See the FBGA 78-Ball Descriptions table.
 2. Dark balls (with ring) designate balls that are specific to controlling the second die of the TwinDie package when compared to a monolithic package.
 3. A comma "," separates the configuration; a slash "/" defines a selectable function. For example: Ball A7 = NF, NF/DM_n/DBI_n/TDQS_t where NF applies to the x4 configuration only. NF/DM_n/DBI_n/TDQS_t applies to the x8 configuration only and is selectable between NF, DM_n, DBI_n, or TDQS_t via MRS.

Table 3: FBGA 78-Ball Descriptions

Symbol	Type	Description
A[17:0]	Input	Address inputs: Provide the row address for ACTIVATE commands and the column address for READ/WRITE commands to select one location out of the memory array in the respective bank. (A10/AP, A12/BC_n, WE_n/A14, CAS_n/A15, RAS_n/A16, have additional functions; see individual entries in this table). The address inputs also provide the op-code during the MODE REGISTER SET command. A16 is used on some 8Gb and 16Gb parts, and A17 is only used on some 16Gb parts.
A10/AP	Input	Auto precharge: A10 is sampled during READ and WRITE commands to determine whether auto precharge should be performed to the accessed bank after a READ or WRITE operation (HIGH = auto precharge; LOW = no auto precharge). A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by the bank group and bank addresses.
A12/BC_n	Input	Burst chop: A12/BC_n is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed. (HIGH = no burst chop; LOW = burst-chopped). See the Command Truth Table.
ACT_n	Input	Command input: ACT_n indicates an ACTIVATE command. When ACT_n (along with CS_n) is LOW, the input pins RAS_n/A16, CAS_n/A15, and WE_n/A14 are treated as row address inputs for the ACTIVATE command. When ACT_n is HIGH (along with CS_n LOW), the input pins RAS_n/A16, CAS_n/A15, and WE_n/A14 are treated as normal commands that use the RAS_n, CAS_n, and WE_n signals. See the Command Truth Table.
BA[1:0]	Input	Bank address inputs: Define the bank (within a bank group) to which an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. Also determines which mode register is to be accessed during a MODE REGISTER SET command.
BG[1:0]	Input	Bank group address inputs: Define the bank group to which a REFRESH, ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. Also determines which mode register is to be accessed during a MODE REGISTER SET command. BG[1:0] are used in the x4 and x8 configurations.
C0/CKE1, C1/CS1_n, C2/ODT1	Input	Stack address inputs: These inputs are used only when devices are stacked; that is, 2H, 4H, and 8H stacks for x4 and x8 configurations (these pins are not used in the x16 configuration). DDR4 will support a traditional dual-die package (DDP), which uses these three signals for control of the second die (CS1_n, CKE1, ODT1). DDR4 is not expected to support a traditional quad-die package (QDP). For all other stack configurations, such as a 4H or 8H, it is assumed to be a single-load (master/slave) type of configuration where C0, C1, and C2 are used as chip ID selects in conjunction with a single CS_n, CKE, and ODT.
CK_t, CK_c	Input	Clock: Differential clock inputs. All address, command, and control input signals are sampled on the crossing of the positive edge of CK_t and the negative edge of CK_c.

Table 3: FBGA 78-Ball Descriptions (Continued)

Symbol	Type	Description
CKE	Input	Clock enable: CKE HIGH activates, and CKE LOW deactivates, the internal clock signals, device input buffers, and output drivers. Taking CKE LOW provides PRE-CHARGE POWER-DOWN and SELF REFRESH operations (all banks idle), or active power-down (row active in any bank). CKE is asynchronous for self refresh exit. After V_{REFCA} has become stable during the power-on and initialization sequence, it must be maintained during all operations (including SELF REFRESH). CKE must be maintained HIGH throughout read and write accesses. Input buffers (excluding CK _t , CK _c , ODT, RESET _n , and CKE are disabled during power-down. Input buffers (excluding CKE and RESET#) are disabled during self refresh.
CS _n	Input	Chip select: All commands are masked when CS _n is registered HIGH. CS _n provides for external rank selection on systems with multiple ranks. CS _n is considered part of the command code.
DM _{nS}	Input	Input data mask: DM _n is an input mask signal for write data. Input data is masked when DM is sampled LOW coincident with that input data during a write access. DM is sampled on both edges of DQS. DM is not supported on x4 configurations. LDM _n is associated with DQ[7:0]. The DM, DBI, and TDQS functions are enabled by mode register settings. See the Data Mask (DM) section.
ODT	Input	On-die termination: ODT (registered HIGH) enables termination resistance internal to the DDR4 SDRAM. When enabled, ODT (R_{TT}) is applied only to each DQ, DQS _t , DQS _c , DM _n /DBI _n /TDQS _t , and TDQS _c signal for the x4 and x8 configurations (when the TDQS function is enabled via mode register). The ODT pin will be ignored if the mode registers are programmed to disable R_{TT} .
PAR	Input	Parity for command and address: This function can be enabled or disabled via the mode register. When enabled, the parity signal covers all command and address inputs, including RAS _n /A16, CAS _n /A15, WE _n /A14, A[17:0], A10/AP, A12/BC _n , BA[1:0], BG[1:0], C0/A18, C1/A19, C2/A20. Control pins NOT covered by the parity signal are CS _n , CKE, and ODT. Unused address pins that are density- and configuration-specific should be treated internally as 0s by the DRAM parity logic.
RAS _n /A16, CAS _n /A15, WE _n /A14	Input	Command inputs: RAS _n /A16, CAS _n /A15, and WE _n /A14 (along with CS _n and ACT _n) define the command and/or address being entered. See the ACT _n description in this table.
RESET _n	Input	Active LOW asynchronous reset: Reset is active when RESET _n is LOW, and inactive when RESET _n is HIGH. RESET _n must be HIGH during normal operation. RESET _n is a CMOS rail-to-rail signal with DC HIGH and LOW at 80% and 20% of V_{DD} ; that is, 960 mV for DC HIGH and 240 mV for DC LOW.
TEN	Input	Connectivity test mode: TEN is active when HIGH and inactive when LOW. TEN must be LOW during normal operation. TEN is a CMOS rail-to-rail signal with DC HIGH and LOW at 80% and 20% of V_{DD} (960mV for DC HIGH and 240mV for DC LOW).

Table 3: FBGA 78-Ball Descriptions (Continued)

Symbol	Type	Description
DQ	I/O	Data input/output: Bidirectional data bus. DQ represents DQ[3:0], and DQ[7:0] for the x4, and x8, respectively. If write CRC is enabled via mode register, the write CRC code is added at the end of data burst. Any one or all of DQ0, DQ1, DQ2, and DQ3 may be used to monitor the internal V_{REF} level during test via mode register setting MR[4] A[4] = HIGH, training times change when enabled. During this mode, R_{TT} value should be set to High-Z. This measurement is for verification purposes and is NOT an external voltage supply pin.
DBI_n	I/O	DBI input/output: Data bus inversion. DBI_n is an input/output signal used for data bus inversion in the x8 configuration. DBI_n is associated with DQ[7:0]. The DBI feature is not supported on x4 configurations. DBI can be configured for both READ (output) and WRITE (input) operations depending on the mode register settings. The DM, DBI, and TDQS functions are enabled by mode register settings. See the Data Bus Inversion (DBI) section.
DQS_t, DQS_c	I/O	Data strobe: Output with READ data, input with WRITE data. Edge-aligned with READ data, centered-aligned with WRITE data. For the x4 and x8 configurations, DQS corresponds to the data on DQ[3:0] and DQ[7:0] respectively. DDR4 SDRAM supports a differential data strobe only and does not support a single-ended data strobe.
ALERT_n	Output	Alert output: This signal allows the DRAM to indicate to the system's memory controller that a specific alert or event has occurred. Alerts will include the command/address parity error and the CRC data error when either of these functions is enabled in the mode register.
TDQS_t, TDQS_c	Output	Termination data strobe: TDQS_t and TDQS_c are used by x8 DRAMs only. When enabled via the mode register, the DRAM will enable the same R_{TT} termination resistance on TDQS_t and TDQS_c that is applied to DQS_t and DQS_c. When the TDQS function is disabled via the mode register, the DM/TDQS_t pin will provide the data mask (DM) function, and the TDQS_c pin is not used. The TDQS function must be disabled in the mode register for the x4 configuration. The DM function is supported only in x8 configuration.
V_{DD}	Supply	Power supply: 1.2V $\pm$ 0.060V.
V_{DDQ}	Supply	DQ power supply: 1.2V $\pm$ 0.060V.
V_{PP}	Supply	DRAM activating power supply: 2.5V -0.125V / +0.250V.
V_{REFCA}	Supply	Reference voltage for control, command, and address pins.
V_{SS}	Supply	Ground.
V_{SSQ}	Supply	DQ ground.
ZQ	Reference	Reference ball for ZQ calibration: This ball is tied to an external 240 Ω resistor (RZQ), which is tied to V_{SSQ} . Note that this ball is shared by two DRAM devices. As a result, ZQ calibration operations need to be carried out separately so that correct values are achieved.
RFU	–	Reserved for future use.
NC	–	No connect: No internal electrical connection is present.
NF	–	No function: May have internal connection present, but has no function.

Functional Description

The TwinDie DDR4 SDRAM is a high-speed, CMOS dynamic random access memory device internally configured as two 16-bank DDR4 SDRAM devices.

Although each die is tested individually within the dual-die package, some TwinDie test results may vary from a like-die tested within a monolithic die package.

The DDR4 SDRAM uses a double data rate architecture to achieve high-speed operation. The double data rate architecture is an $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O balls. A single read or write access consists of a single $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding n -bit-wide, one-half-clock-cycle data transfers at the I/O balls.

The differential data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the DDR4 SDRAM input receiver. DQS is center-aligned with data for WRITES. The read data is transmitted by the DDR4 SDRAM and edge-aligned to the data strobes.

Read and write accesses to the DDR4 SDRAM are burst-oriented. Accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Operation begins with the registration of an ACTIVATE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVATE command are used to select the bank and row to be accessed. The address bits (including $CSn\#$, BAn , and An) registered coincident with the READ or WRITE command are used to select the rank, bank, and starting column location for the burst access.

This data sheet provides a general description, package dimensions, and the package ballout. Refer to the Micron monolithic DDR4 data sheet for complete information regarding individual die initialization, register definition, command descriptions, and die operation.

Industrial Temperature

The industrial temperature (IT) option, if offered, requires that the case temperature not exceed -40°C or 95°C . JEDEC specifications require the refresh rate to double when T_C exceeds 85°C ; this also requires use of the high-temperature self refresh option. Additionally, ODT resistance, I_{DD} values, some I_{DD} specifications and the input/output impedance must be derated when T_C is $< 0^{\circ}\text{C}$ or $> 95^{\circ}\text{C}$. See the DDR4 monolithic data sheet for details.

Figure 2: Functional Block Diagram (64 Meg x 4 x 16 Banks x 2 Ranks)

Electrical Specifications – Leakages

Table 4: Input and Output Leakages

Symbol	Parameter	Min	Max	Units	Notes
I_I	Input leakage current Any input $0V \leq V_{IN} \leq V_{DD}$, V_{REF} pin $0V \leq V_{IN} \leq 1.1V$ (All other pins not under test = 0V)	-4	4	μA	1
I_{VREF}	V_{REF} supply leakage current $V_{REFDQ} = V_{DD}/2$ or $V_{REFCA} = V_{DD}/2$ (All other pins not under test = 0V)	-2	4	μA	2
I_{ZQ}	Input leakage on ZQ pin	-6	6	μA	
I_{TEN}	Input leakage on TEN pin	-8	8	μA	
I_{OZPD}	Output leakage: $V_{OUT} = V_{DDQ}$	-	10	μA	3
I_{OZPU}	Output leakage: $V_{OUT} = V_{SSQ}$	-100	-	μA	3, 4

- Notes:
- Any input $0V < V_{IN} < 1.1V$
 - $V_{REFCA} = V_{DD}/2$, V_{DD} at valid level.
 - DQs are disabled.
 - ODT is disabled with the ODT input HIGH.

Temperature and Thermal Impedance

It is imperative that the DDR4 SDRAM device's temperature specifications, shown in the following table, be maintained in order to ensure the junction temperature is in the proper operating range to meet data sheet specifications. An important step in maintaining the proper junction temperature is using the device's thermal impedances correctly. The thermal impedances listed in Table 6 (page 10) apply to the current die revision and packages.

Incorrectly using thermal impedances can produce significant errors. Read Micron technical note TN-00-08, "Thermal Applications," prior to using the values listed in the thermal impedance table. For designs that are expected to last several years and require the flexibility to use several DRAM die shrinks, consider using final target theta values (rather than existing values) to account for increased thermal impedances from the die size reduction.

The DDR4 SDRAM device's safe junction temperature range can be maintained when the T_C specification is not exceeded. In applications where the device's ambient temperature is too high, use of forced air and/or heat sinks may be required to satisfy the case temperature specifications.

Table 5: Thermal Characteristics

Notes 1–3 apply to entire table

Parameter	Symbol	Value	Units	Notes
Operating temperature	T_C	0 to 85	°C	
		0 to 95	°C	4

- Notes:
1. MAX operating case temperature T_C is measured in the center of the package, as shown below.
 2. A thermal solution must be designed to ensure that the device does not exceed the maximum T_C during operation.
 3. Device functionality is not guaranteed if the device exceeds maximum T_C during operation.
 4. If T_C exceeds 85°C, the DRAM must be refreshed externally at 2x refresh, which is a 3.9μs interval refresh rate. The use of self refresh temperature (SRT) or automatic self refresh (ASR), if available, must be enabled.

Figure 4: Temperature Test Point Location

Table 6: Thermal Impedance

Package	Substrate	Θ_{JA} (°C/W) Airflow = 0m/s	Θ_{JA} (°C/W) Airflow = 1m/s	Θ_{JA} (°C/W) Airflow = 2m/s	Θ_{JB} (°C/W)	Θ_{JC} (°C/W)	Notes
78-ball	Low conductivity	51.0	39.2	34.7	12.7	2.2	1
	High conductivity	30.4	25.0	23.2			

- Note:
1. Thermal resistance data is based on a number of samples from multiple lots and should be viewed as a typical number.

Electrical Specifications – I_{CDD} Parameters

Table 7: DDR4 I_{CDD} Specifications and Conditions (Rev. A)

Note 1 applies to the entire table

Combined Symbol	Individual Die Status	Bus Width	DDR4-2133	DDR4-2400	Units
I _{CDD0}	I _{CDD0} = I _{DD0} + I _{DD2P} + 3	x4, x8	93	99	mA
I _{CPP0}	I _{CPP0} = I _{PP0} + I _{PP3N}	x4, x8	7	7	mA
I _{CDD1}	I _{CDD1} = I _{DD1} + I _{DD2P} + 3	x4, x8	98	103	mA
I _{CDD2N}	I _{CDD2N} = I _{DD2N} + I _{DD2P}	x4, x8	76	82	mA
I _{CDD2NT}	I _{CDD2NT} = I _{DD2NT} + I _{DD2P}	x4, x8	84	90	mA
I _{CDD2P}	I _{CDD2P} = I _{DD2P} + I _{DD2P}	x4, x8	60	64	mA
I _{CDD2Q}	I _{CDD2Q} = I _{DD2Q} + I _{DD2P}	x4, x8	69	73	mA
I _{CDD3N}	I _{CDD3N} = I _{DD3N} + I _{DD2P}	x4, x8	93	99	mA
I _{CPP3N}	I _{CPP3N} = I _{PP3N} + I _{PP3N}	x4, x8	6	6	mA
I _{CDD3P}	I _{CDD3P} = I _{DD3P} + I _{DD2P}	x4, x8	74	76	mA
I _{CDD4R}	I _{CDD4R} = I _{DD4R} + I _{DD2P} + 3	x4, x8	183	195	mA
I _{CDD4W}	I _{CDD4W} = I _{DD4W} + I _{DD2P} + 3	x4, x8	193	215	mA
I _{CDD5B}	I _{CDD5B} = I _{DD5B} + I _{DD2P}	x4, x8	220	224	mA
I _{CPP5B}	I _{CPP5B} = I _{PP5B} + I _{PP3N}	x4, x8	25	25	mA
I _{CDD6N}	I _{CDD6N} = I _{DD6N} + I _{DD6N}	x4, x8	40	40	mA
I _{CDD6E}	I _{CDD6E} = I _{DD6E} + I _{DD6E}	x4, x8	54	54	mA
I _{CDD6R} ²	I _{CDD6R} = I _{DD6R} + I _{DD6R}	x4, x8	20	20	mA
I _{CDD6A} (25°C) ²	I _{CDD6A} = I _{DD6A} + I _{DD6A}	x4, x8	18	18	mA
I _{CDD6A} (45°C) ²	I _{CDD6A} = I _{DD6A} + I _{DD6A}	x4, x8	20	20	mA
I _{CDD6A} (75°C) ²	I _{CDD6A} = I _{DD6A} + I _{DD6A}	x4, x8	32	32	mA

Table 7: DDR4 I_{CDD} Specifications and Conditions (Rev. A) (Continued)

Note 1 applies to the entire table

Combined Symbol	Individual Die Status	Bus Width	DDR4-2133	DDR4-2400	Units
I _{CDD7}	I _{CDD7} = I _{DD7} + I _{DD2P} + 3	x4, x8	218	245	mA
I _{CPP7}	I _{CPP7} = I _{PP7} + I _{PP3N}	x4, x8	15	17	mA
I _{CDD8}	I _{CDD8} = I _{DD8} + I _{DD8}	x4, x8	36	36	mA

- Notes:
1. I_{CDD} values reflect the combined current of both individual die. I_{DDx} represents individual die values.
 2. I_{CDD6R} and I_{CDD6A} values are typical.

Package Dimensions

Figure 5: 78-Ball FBGA Die Rev. A (package code TRF)

- Notes:
1. All dimensions are in millimeters.
 2. Solder ball material: SAC305 (96.5% Sn, 3% Ag, 0.5% Cu).
