

200MHz Slew Enhanced VFA

The EL5100, EL5101, and EL5300 represent high-speed voltage feedback amplifiers based on the current feedback amplifier architecture. This gives the typical high slew rate benefits of a CFA family along with the stability and ease of use associated with the VFA type architecture. This family is available in single, dual, and triple versions, with 200MHz, 400MHz, and 700MHz versions. This family operates on single 5V or $\pm 5V$ supplies from minimum supply current. The EL5100 and EL5300 also feature an output enable function, which can be used to put the output in to a high-impedance mode. This enables the outputs of multiple amplifiers to be tied together for use in multiplexing applications.

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which is compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020C.

Features

- Pb-free available as an option
- Specified for 5V or $\pm 5V$ applications
- Power-down to 17 μA /amplifier
- -3dB bandwidth = 200MHz
- ± 0.1 dB bandwidth = 20MHz
- Low supply current = 2.5mA
- Slew rate = 2200V/ μs
- Low offset voltage = 4mV max
- Output current = 100mA
- $A_{VOL} = 1000$
- Diff gain/phase = 0.08%/0.1°

Applications

- Video amplifiers
- PCMCIA applications
- A/D drivers
- Line drivers
- Portable computers
- High speed communications
- RGB applications
- Broadcast equipment
- Active filtering

Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$)

Supply Voltage between V_{S+} and GND. 13.2V
 Input Voltage $\pm V_S$
 Differential Input Voltage $\pm 4\text{V}$
 Maximum Output Current. 80mA

Storage Temperature Range -65°C to $+150^\circ\text{C}$
 Ambient Operating Temperature Range -40°C to $+85^\circ\text{C}$
 Operating Junction Temperature 150°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

DC Electrical Specifications $V_S = \pm 5\text{V}$, $\text{GND} = 0\text{V}$, $T_A = 25^\circ\text{C}$, $V_{CM} = 0\text{V}$, $V_{OUT} = 0\text{V}$, $V_{ENABLE} = \text{GND}$ or OPEN , unless otherwise specified.

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNIT
V_{OS}	Offset Voltage		-4	1	4	mV
TCV_{OS}	Offset Voltage Temperature Coefficient	Measured from T_{MIN} to T_{MAX}		8		$\mu\text{V}/^\circ\text{C}$
I_B	Input Bias Current	$V_{IN} = 0\text{V}$	-6	2	6	μA
I_{OS}	Input Offset Current	$V_{IN} = 0\text{V}$	-2.5	0.5	2.5	μA
TCI_{OS}	Input Bias Current Temperature Coefficient	Measured from T_{MIN} to T_{MAX}		8		$\text{nA}/^\circ\text{C}$
PSRR	Power Supply Rejection Ratio		70	90		dB
CMRR	Common Mode Rejection Ratio	V_{CM} from -3V to $+3\text{V}$	60	75		dB
CMIR	Common Mode Input Range	Guaranteed by CMRR test	-3		+3	V
R_{IN}	Input Resistance	$V_{IN} = -3\text{V}$ to $+3\text{V}$	0.7	1.2		$\text{M}\Omega$
C_{IN}	Input Capacitance			1		pF
$I_{S,ON}$	Supply Current - Enabled	Per amplifier	2.1	2.5	2.9	mA
$I_{S,OFF}$	Supply Current - Shut Down	V_{S+} , per amplifier	-5	0	5	μA
		V_{S-} , per amplifier	5	17	25	μA
PSOR	Power Supply Operating Range		3.3		12	V
AVOL	Open Loop Gain	$R_L = 1\text{k}\Omega$ to GND, V_{OUT} from -2.5V to $+2.5\text{V}$	55	60		dB
V_{OP}	Positive Output Voltage Swing	$R_L = 150\Omega$ to GND	3.2	3.4		V
		$R_L = 1\text{k}\Omega$ to GND	3.6	3.8		V
V_{ON}	Negative Output Voltage Swing	$R_L = 150\Omega$ to GND		-3.4	-3.2	V
		$R_L = 1\text{k}\Omega$ to GND		-3.8	-3.6	V
I_{OUT}	Output Current	$R_L = 10\Omega$ to 0V	± 60	± 100		mA
V_{IH-EN}	ENABLE pin Voltage for Power Up		$V_{S+} - 4$			V
V_{IL-EN}	ENABLE pin Voltage for Shut Down				$V_{S+} - 1$	V
I_{EN}	Enable Pin Current	Enabled, $V_{EN} = 0\text{V}$	-1		1	μA
		Disabled, $V_{EN} = 5\text{V}$	5	17	25	μA

EL5100, EL5101, EL5300

Closed Loop AC Electrical Specifications $V_S = \pm 5V$, $T_A = 25^\circ C$, $V_{ENABLE} = 0V$, $A_V = +1$, $R_F = 0\Omega$, $R_L = 150\Omega$ to GND, unless otherwise specified.

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNIT
BW	-3dB Bandwidth ($V_{OUT} = 200mV_{P-P}$)	$V_S = \pm 5V$, $A_V = 1$, $R_F = 0\Omega$	150	200		MHz
SR	Slew Rate	$R_L = 100\Omega$, $V_{OUT} = -3V$ to $+3V$, $A_V = +2$	1500	2200	4500	V/ μs
t_R, t_F	Rise Time, Fall Time	$\pm 0.1V$ step		2.8		ns
OS	Overshoot	$\pm 0.1V$ step		10		%
t_{PD}	Propagation Delay	$\pm 0.1V$ step		3.2		ns
t_S	0.1% Settling Time	$V_S = \pm 5V$, $R_L = 500\Omega$, $A_V = 1$, $V_{OUT} = \pm 2.5V$		20		ns
dG	Differential Gain	$A_V = 2$, $R_L = 150\Omega$, $V_{INDC} = -1$ to $+1V$		0.08		%
dP	Differential Phase	$A_V = 2$, $R_L = 150\Omega$, $V_{INDC} = -1$ to $+1V$		0.1		$^\circ$
e_N	Input Noise Voltage	$f = 10kHz$		10		nV/ \sqrt{Hz}
i_N	Input Noise Current	$f = 10kHz$		7		pA/ \sqrt{Hz}
t_{DIS}	Disable Time			180		ns
t_{EN}	Enable Time			650		ns

Application Information

Video Amplifier with Reduced Size Output Capacitance

If you have a video line driver $Z = 75\Omega$, the DC decoupling capacitor could be relatively large.

$$C = \frac{1}{2\pi \times R \times f} =$$

$f = 10\text{Hz}, R = Z = 75\Omega, C = 132\mu\text{F}$

By using the circuit below, C could be reduced to $C2 = 22\mu\text{F}$.

FIGURE 29.

FIGURE 30. VIDEO-

The test result is shown on Figure 30.

By selecting a different value for C1, we could reduce the effect, created by C3 R3 and get flat response from 16Hz

with an 1/5 value, price and size output capacitor. There is another, very important issue by using high bandwidth amplifiers.

In the past when the bandwidth of the operational amplifier ended at a few hundred kHz even at few MHz, the power-supply bypass was not a very critical issue, since a 0.1µF capacitor “did the job”, but today’s amplifiers could have bandwidth, what used to be reserved for microwave circuits not to long time ago.

Therefore that high bandwidth amplifiers require the same respect what we reserve for microwave circuits. Particularly the power supply bypass and the pcb-layout could very heavily influence the performance of a modern high bandwidth amplifiers. It could happen above a few MHz, but it will happen above 100MHz, that the capacitor will behave like an inductor.

The reason for that is the very small but not zero value serial inductance of the capacitor.

FIGURE 31.

The capacitor will behave as a capacitor up to its resonance frequency, above the resonance frequency it will behave as an inductor.

Just 1nHy inductance serial with 1nF capacitance will have serial resonance at:

$$F = \frac{1}{2\pi\sqrt{L \times C}}$$

C = 1nF, L = 1nHy, F = 159 MHz

And another 1nHy is very easy to get together with the inductance of traces on the pcb, and therefore you could encounter resonances from ca 50MHz and above anywhere. So if the amplifier has a bandwidth of a few hundred MHz, the proper power supply by-pass could become a serious if not difficult task.

Intuitively, you would use capacitors value 0.1µF parallel with a few µF tantalum, and to cure the effect of its serial resonance put a smaller one parallel to it.

The result will surprise to you, because you will get even something worse than without the small capacitor.

What is happening there? Just look what we get:

FIGURE 32.

Above its serial resonance C2* the ideal capacitance of C2 is a short, the Tantalum capacitor for high frequencies is not effective, the left over is C1 capacitor and L1 + L2 inductors, we get a parallel tank circuit, which is at its resonance a high impedance path and do not carry any high frequency current, it does not work as bypass at all!

The impedance of a parallel tank circuit at resonance is dependent from its Q. High Q high impedance.

The Q of a parallel tank circuit could be reduced by bypassing it with a resistor, or adding a resistor in serial to one of the reactive components. Since the bypassing would short the DC supply we do have to go to add resistor in serial to the reactive component, we will add a resistor serial with the inductor. (See Figure 33.)

FIGURE 33.

The final power supply bypass circuit will look:
