

DP83910A

DP83910A CMOS SNI Serial Network Interface

Literature Number: SNLS386

DP83910A CMOS SNI Serial Network Interface

General Description

The DP83910A CMOS Serial Network Interface (SNI) is a direct-pin equivalent of the bipolar DP8391 SNI and provides the Manchester data encoding and decoding functions for IEEE 802.3 Ethernet/Thin-Ethernet type local area networks. The SNI interfaces the DP8390 Network Interface Controller (NIC) to the DP8392 CTI or an Ethernet transceiver cable. When transmitting, the SNI converts non-return-to-zero (NRZ) data from the controller into Manchester data and sends the converted data differentially to the transceiver. Conversely, when receiving, a Phase Lock Loop decodes the 10 Mbit/s data from the transceiver into NRZ data for the controller.

The DP83910A operates in conjunction with the DP8392 Coaxial Transceiver Interface (CTI) and the DP8390 Network Interface Controller (NIC) to form a three-chip set that implements a complete IEEE 802.3 compatible network as shown below. The DP83910A is a functionally complete Manchester encoder/decoder including a balanced driver and receiver, on-board crystal oscillator, collision signal translator, and a diagnostic loopback feature. The

DP83910A, fabricated CMOS, typically consumes less than 70 mA of current. However, as a result of being CMOS, the DP83910A's differential signals must be isolated in both Ethernet and thin wire Ethernet.

Features

- Compatible with Ethernet I, IEEE 802.3; 10BASE5, 10BASE2, and 10BASE-T
- Designed to interface with 10BASE-T transceivers
- Functional and pin-out duplicate of the DP8391
- 10 Mbits/s Manchester encoding/decoding with receive clock recovery
- Requires no precision components
- Loopback capability for diagnostics
- Externally selectable half or full step modes of operation at transmit output
- Squelch circuitry at the receive and collision inputs to reject noise
- TTL/MOS compatible controller interface

3.0 Functional Description

The DP83910A consists of five main logical blocks:

- The oscillator generates the 10 MHz transmit clock signal for system timing.
- The Manchester encoder accepts NRZ data from the controller, encodes the data to Manchester, and transmits it differentially to the transceiver, through the differential transmit driver.
- The Manchester decoder receives Manchester data from the transceiver, converts it to NRZ data and clock pulses, and sends it to the controller.
- The collision translator indicates to the controller the presence of a valid 10 MHz collision signal to the PLL.
- The loopback circuitry, when asserted, routes the data from the Manchester encoder back to the PLL decoder.

3.1 OSCILLATOR

The oscillator is controlled by a 20 MHz parallel resonant crystal connected between X1 and X2 or by an external clock on X1. The 20 MHz output of the oscillator is divided by 2 to generate the 10 MHz transmit clock for the controller. The oscillator also provides internal clock signals to the encoding and decoding circuits.

If a crystal is connected to the DP83910A, it is recommended that the circuit shown in Figure 1 be used and that the components used meet the following:

Crystal XT1: AT cut parallel resonant crystal
 Series Resistance: $\leq 10\Omega$
 Specified Load Capacitance: 13.5 pF
 Accuracy: 0.005% (50 ppm)

C1, C2: Load Capacitor, 27 pF.

The resistor, R1, in Figure 1 may be required in order to minimize frequency drift due to changes in the V_{CC} supply voltage. If R1 is required, its value must be carefully selected. R1 decreases the loop gain. Thus, if R1 is made too large, the loop gain will be greatly reduced and the crystal will not oscillate. If R1 is made too small, normal variations in the V_{CC} may cause the oscillation frequency to drift out of specification. As the first rule of thumb, the value of R1

TL/F/9365-15

Note 1: The resistor R1 may be required in order to minimize frequency drift due to changes in the V_{CC} . See text description.

FIGURE 1. Crystal Connection to DP83910A
 (see text for component values)

should be made equal to five times the motional resistance of the crystal.

The motional resistance of 20 MHz crystals is usually in the range of 10Ω to 30Ω . This implies that a reasonable value for R1 should be in the range of 50Ω – 150Ω .

The decision of whether or not to include R1 should be based upon measured variations of crystal frequency as each of the circuit parameters is varied.

According to the IEEE 802.3 standard, the entire oscillator circuit (crystal and amplifier) must be accurate to 0.01%. When using a crystal, the X1 pin is not guaranteed to provide a TTL compatible logic output, and should not be used to drive external standard logic. If additional logic needs to be driven, then an external oscillator should be used, as described in the following.

3.2 OSCILLATOR MODULE OPERATION

If the designer wishes to use a crystal clock oscillator, one that provides the following should be employed:

- 1) TTL or CMOS output with a 0.01% frequency tolerance
- 2) 40%–60% duty cycle
- 3) ≥ 2 TTL load output drive ($I_{OL} = 3.2$ mA)

3.0 Functional Description (Continued)

The circuit is shown in *Figure 2*. (Additional output drive may be necessary if the oscillator must also drive other components.) When using a clock oscillator it is still recommended that the designer connect the oscillator output to the X1 pin and tie the X2 pin to ground.

3.3 MANCHESTER ENCODER AND DIFFERENTIAL DRIVER

The encoder begins operation when the Transmit Enable input (TXE) goes high and converts clock and NRZ data to Manchester data for the transceiver. For the duration of TXE remaining high, the Transmitted Data (TXD) is encoded for the transmit-driver pair (TX $\pm$). TXD must be valid on the rising edge of Transmit Clock (TXC). Transmission ends when TXE goes low. The last transition is always positive; it occurs at the center of the bit cell if the last bit is a one, or at the end of the bit cell if the last bit is a zero.

The differential transmit pair from the secondary of the isolation transformer drives up to 50 meters of twisted pair AUI cable. These outputs are source followers which require two 270 Ω pull-down resistors to ground.

The DP83910A allows both half-step and full-step to be compatible with Ethernet I and IEEE 802.3. With the SEL pin low (for Ethernet I), transmit+ is positive with respect to transmit- during idle; with SEL high (for IEEE 802.3), transmit+ and transmit- are equal in the idle state. This provides zero differential voltage to operate with transformer coupled loads.

3.4 MANCHESTER DECODER

The decoder consists of a differential receiver and a PLL to separate Manchester encoded data stream into clock signals and NRZ data. The differential input must be externally terminated with two 39 Ω resistors connected in series if the standard 78 Ω transceiver drop cable is used; in Thin-Ethernet applications, these resistors are optional. To prevent noise from falsely triggering the decoder, a squelch circuit at the input rejects signals with levels less than -175 mV. Once the input exceeds the squelch requirements, Carrier Sense (CRS) is asserted. Receive data (RXD) and receive clock (RXC) become valid typically within 6 bit times. The DP83910A may tolerate bit jitter up to 18 ns in the received data.

The decoder detects the end of a frame when no more midbit transitions are detected. Within one and a half bit times after the last bit, carrier sense is de-asserted. Receive clock stays active for five more bit times after CRS goes low to guarantee the receive timings of the DP8390 NIC.

3.5 COLLISION TRANSLATOR

When the Ethernet transceiver (DP8392 CTI) detects a collision, it generates a 10 MHz signal to the differential collision inputs (CD $\pm$) of the DP83910A. When these inputs are detected active, the DP83910A translates the 10 MHz signal to an active high level for the controller. The controller uses this signal to back off its current transmission and reschedule another one.

The collision differential inputs are terminated the same way as the differential receive inputs. The squelch circuitry is also similar, rejecting pulses with levels less than -175 mV.

3.6 LOOPBACK FUNCTIONS

When the Loopback input (LBK) is asserted high, the DP83910A redirects its transmitted data back into its receive path. This feature provides a convenient method for testing both chip and system level integrity. The transmit driver and receive input circuitry are disabled in loopback mode.

5.0 Typical Application

Interface for Ethernet and Thin Wire Ethernet Using Single Jumper for Thin/Thick Selection

TL/F/9365-3

6.0 Pin Descriptions

24-Pin DIP	28-Pin PCC	Name	I/O	Description
1	1	COL	O	COLLISION DETECT OUTPUT: Generates an active high signal when 10 MHz collision signal is detected.
2	2	RXD	O	RECEIVE DATA OUTPUT: NRZ data output from the PLL. This signal must be sampled on the rising edge of receive clock.
3	3	CRS	O	CARRIER SENSE: Asserted on the first valid high-to-low transition on the RX $\pm$ pair. Remains active until 1.5 bit times after the last bit in data.
4	4	RXC	O	RECEIVE CLOCK: The receive clock from the Manchester data after the PLL has locked. Remains active 5 bit times after deasserting CRS.
5	5	SEL	I	MODE SELECT: When high, transmit + and transmit – are the same voltage in the idle state. When low, transmit + is positive with respect to transmit – in the idle state, at the transformer's primary.
6	7 8 9	V _{SS} V _{SS} V _{SS}		GROUND PIN
7	10	LBK	I	LOOPBACK: When high, the loopback mode is enabled.
8	11	X1	I	CRYSTAL OR EXTERNAL OSCILLATOR INPUT
9	12	X2	O	CRYSTAL FEEDBACK OUTPUT: Used in crystal connections only. Connected to ground when using an external oscillator.
10	13	TXD	I	TRANSMIT DATA INPUT: NRZ data input from the controller. The data is combined with the transmit clock to produce Manchester data. TXD is sampled on the rising edge of transmit clock.
11	14	TXC	O	TRANSMIT CLOCK: The 10 MHz clock derived from the 20 MHz oscillator.
12	15	TXE	I	TRANSMIT ENABLE: The encoder begins operation when this input is asserted high.
13 14	16 17	TX – TX +	O	TRANSMIT OUTPUT: Differential line driver which sends the encoded data to the transceiver. The outputs are source followers which require 270 Ω pull-down resistors.
15	6	NC		NO CONNECTION: This may be tied to V _{SS} for the PLCC version to be compatible with the DP8391.
16	18	NC		NO CONNECTION
17	19	TEST	I	FACTORY TEST INPUT: Used to check the chip's internal functions. May be tied low or have a 0.01 μ f bypass capacitor to ground (for compatibility with the bipolar DP8391) during normal operation.
18 19	20 21 22 23	V _{DD} V _{DD} V _{DD} V _{DD}		POWER CONNECTION
20	24	NC		NO CONNECTION
21 22	25 26	RX – RX +	I	RECEIVE INPUT: Differential receive input pair from the transceiver.
23 24	27 28	CD – CD +	I	COLLISION INPUT: Differential collision pair input from the transceiver.

7.0 Absolute Maximum Ratings

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (V_{CC})	−0.5V to +7V
DC Input Voltage (V_{IN})	−0.5V to $V_{CC} + 0.5V$
DC Output Voltage (V_{OUT})	−0.5V to $V_{CC} + 0.5V$
Differential Input Voltage	−5.5 to +16V
Differential Output Voltage	0 to 16V
Power Dissipation	500 mW
Storage Temperature	−65°C to +150°C

Lead Temperature (Soldering, 10 sec.)	260°C
ESD ($R_{ZAP} = 1.5\text{ k}\Omega$, $C_{ZAP} = 120\text{ pF}$)	$\geq 2\text{ kV}$
	(Pin 4 = 1.5 kV)

Note: Absolute maximum ratings are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits.

*Note: An asterisk following a parameter's symbol indicates that the parameter has been characterized but not tested.

Note: All specifications in this datasheet are valid only if the mandatory isolation is employed and all differential signals are taken to exist at the AUI side of the pulse transformer.

8.0 DC Specifications $T_A = 0^\circ\text{C}$ to 70°C , $V_{CC} = 5V \pm 5\%$

Symbol	Parameter	Conditions	Min	Typ	Max	Units
Controller Interface Pins (COL, RXD, CRS, RXC, SEL, LBK, TXD, TXC and TXE)						
V_{IH}	Input High Voltage		2.0			V
V_{IL}	Input Low Voltage				0.8	V
I_{IN}	Input Leakage	$V_{IN} = V_{CC}$ or GND	−1.0		1.0	μA
V_{OH}	Output High Voltage	(TTL) $I_{OH} = 2.0\text{ mA}$ (CMOS) $I_{OH} = 20\text{ }\mu\text{A}$	3.5 $V_{CC} - 0.1$			V V

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
